TITLE: New path in ¹⁶constructive function science

SOURCE: MTA. Matematikai es fizikai osztalyanak koslemenyei, v. 16, no. 1, 1966, 33-45

TOPIC TAGS: function analysis, function

ABSTRACT: This article is the text of the author's lecture delivered at the 25 Mar 1965 meeting of the Academy. It was shown that rational fraction functions are the simplest examples of non-linear constructive function science. The new path involves the utilization of the fact that the value calculations in fraction functions are the same as those for polynoms. Orig. art. has: 33 formulas. [JPRS]

TITLE: Experience in the use of the GM-4 marigraph for measuring variations in the level of Arctic seas

CITED SOURCE: Tr. Arkt. i Antarkt. n.-i. in-ta, v. 254, 1963, 60-62

TOPIC TAGS: Marigraph, mareograph, tide gage, Arctic sea level, hydrostatic pressure gage

TRANSLATION: A self-contained instrument designed for operation at depths up to 100 m is also used to record variations in the total (atmospheric and hydrostatic) pressure at the horizon of the marigraph, and also the air temperature. The operation of the instrument is based on an automatic transformation of the displacement of the sensing elements acted upon by the total pressure and temperature into a recording on light-sensitive film. The pressure and temperature pickups used are, respectively, a spring-actuated

1. Institut fiziologii imeni Bogomol'tsa AN UkrSSR, Kiyev.

amount of oxygen. It was found that in dogs two to three weeks old, the high level of oxygen consumption exceeded the amount supplied to the tissues by the blood. The high minute reserve of blood

only 57 percent that of arterial blood, whereas in adult dogs, oxygen reserve is 70 percent that of arterial blood. The hemodynamic coefficient indicating the blood flow needed for the consumption of a liter of oxygen in 2-3-wk old dogs is relatively low, which attests to the weakness of hemodynamics in this age period in spite of intense

consumption decreases with age as does the heart rate.

dogs. The minute oxygen reserve both in arterial and venous blood is lower than in all other age groups. The "oxygen pulse" is significantly lowered compared to all other groups, which indicates that the heart is less efficient in animals of advanced age. Orig.
