SOURCE: Pomiarly automatyka kontrola, no. 9, 1965, 388-391

TOPIC TAGS: nuclear engineering, measuring apparatus, electronic measurement, laboratory equipment, radiation dosimeter, radiometer, electronic industry, scientific standard

ABSTRACT: The Biuro Urzadzen Techniki Jadrowej BUTJ (Office for Nuclear Engineering Equipment) has its own pilot plants in Warsaw and Bydgoszcz where some of the nuclear engineering equipments are manufactured. The equipment are made to uniform technical and by the ZOPAN and ELTRA enterprises are for Nuclear Engineering Equipment. The equipment set up by the Office for Nuclear Engineering, dosimetric, and industrial under manufacture are for laboratory, pulse generators, feeders, and purposes. They include oscilloscopes, pulse generators, feeders,

Authors : Orlov, S. A., and M. Z. Turevskiy  
Title : Machining of distributing drums and divisional discs  
without help of templates.  
Periodical : Stan. 1 instr., 6, 41-43, Je 1956  
Abstract : The authors describe the machining of divisional discs  
and distributing drums made without use of template and  
with a precision of 0.01. The work was done on the  
"Hille-Verke" coordinate-boring machine. Four drawings,  
2 GOST standards.

[Combating wind erosion in the sands of the lower Dnieper.] *Vinodelie i Vinogradarstvo SSSR*, Moscow, No. 5:27-30, May 1952. DIC—In connection with the forthcoming completion of Kakhovskaya Hydroelectric Plant and the opening of the South Ukrainian Canal, large areas of arid lands will be irrigated and become available for agriculture and viticulture in particular. Author discusses the causes and effects of wind erosion in the sands and suggests a series of definite successive measures of combatting drifting sands and setting up vineyards in the plains of the lower Dnieper. A schematic drawing explaining how to organize and lay out a future vineyard on sands surrounded by protective forest belts is added. *Subject Heading:*

Pavol Holéczy, Engineer.

PURPOSE: This collection of articles is intended for scientists  
and engineers interested in the subjects discussed.

COVERAGE: This collection of 13 articles written by members of  
the faculty of the Košice Higher Technical School covers a  
variety of subjects, including mathematics, metallurgy,  
mining engineering, etc. Each article is accompanied by a  
resumé in Slovak, Russian, and German. References are  
listed at the end of each article; the majority of listings  
are Slovak, German, and Soviet.

TITLE: Determinating the saturated hydrocarbon content in mixtures with saturated monatomic alcohols

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1962, 201, abstract 23D167 (Tr. Vses. n.-i. in-t neftekhim. protsessov, no. 5, 1962, 75-80)

TEXT: The authors examine the possibility of determining the hydrocarbons (HC) which are formed together with alcohols when fatty acids are hydrogenated. A chromatographic method is described. 3-5 g of the substance are dissolved in 15 ml hexene (I) (obtained by dehydrating hexyl alcohol in vapor phase over activated  $Al_2O_3$ ) and the solution is transferred to a column 500-600mm long and 10-12 mm in diameter and filled with 25-30 g of ACM (ASM) silica gel (61-120 mesh). The column is eluted with 10 ml I and then with 60-70 ml  $C_2H_5OH$ . All the HC is contained in the first 20 ml of the eluate. ✓

This fraction of the eluate is transferred to a calibrated flask and most of the I is distilled off with a dephlegmator at a water-bath temperature Card 1/2

Determinating the saturated ...

S/081/62/000/023/027/120  
B158/B180

of 75-95°C: On cooling, the flask is weighed and the combined weight of HC and residual I determined. The contents of the flask are dissolved in 20-30 ml octane, transferred to a 100 ml measuring flask, the solution being made up to the mark with octane, and I is determined bromatometrically (the value of I is checked in a control test). The HC content is calculated from the difference. The determination error is  $\pm 0.1-0.9\%$  (absolute). [Abstracter's note: Complete translation.] ✓

TITLE: A logic device for self-adjusting systems. Class 21, No. 181171

SOURCE: Izobrotoniya, promyshlennyye obratzys, tovarnyye znaki, no. 9, 1966, 41

TOPIC TAGS: self adaptive control, logic circuit

ABSTRACT: This Author Certificate presents a logic device for self-adjusting systems. The device includes an input amplifier, the output of which (on one side) is connected to a frequency modulator, a pulse shaper, and a reversible counter (see Fig. 1). The other side of the output of the input amplifier is connected to the command device connected through a trigger to the reversible counter. The design improves the response time with the simultaneous increase of precision and selectivity based on the fundamental harmonic of the input signal with the determination of its zero value. The output of the reversible counter is connected by parallel tie lines to the set of switches operating in series. The chief discharge switch is connected to the trigger controlling the zero indicator and to the switching circuit containing the output controlled rectifier.

To determine the sign of the increment of the average input signal value, the output of the reversible counter is connected by parallel tie lines to the potential coincidence circuit. The output of the potential coincidence circuit is connected through a differentiating circuit to the output controlled rectifier. To measure the increment of the average value of the input signal, the output of the reversible counter is connected by parallel tie lines to the discriminator. The output of the discriminator is connected to the digital indicator with a memory. Orig. art. has: 1 figure.

TITLE: A small-parameter scheme for calculating ageostrophic winds

SOURCE: AN UzSSR. Institut matematiki. Resheniye uravneniy gidrotermodynamiki primenitel'no k zadacham meteorologii (Solution of equations in hydrothermodynamics applied to problems in meteorology) Tashkent, Izd-vo FAN UzSSR, 1966, 73-86

TOPIC TAGS: wind profile, eigenvector, boundary value problem, parameter, atmospheric model, characteristic equation, correlation function

ABSTRACT: An attempt is made to reduce the number of parameters that describe the vertical profiles of meteorologic elements in the presence of nongeostrophic equations. The work starts with the optimal representations of the vertical temperature profiles

$$T(x, y, p, t) = T_0(x, y, p) + \sum_{i=1}^n T(x, y, t) \tau_i(p).$$

Comparison of the calculated vectors  $\tau_i$  with an optimal wind-vector system shows that the first vector for the geopotential and wind profiles can be determined with

Card 1/2

ACC NR: AT7002817

sufficient accuracy with a one-parameter representation of the temperature profile. The equation for one component of the ageostrophic wind has the form:

$$\frac{\partial^2 \bar{u}'}{\partial x^2} + \frac{\partial^2 \bar{u}'}{\partial y^2} + \frac{\zeta^2}{f^2} \frac{\partial^2 \bar{u}'}{\partial \zeta^2} = -\frac{2}{f^2 a^2} \left\{ \zeta^2 \frac{\partial \Phi}{\partial \zeta} \cdot \frac{\partial \Phi}{\partial x} \right\} + \frac{i}{f} \frac{\partial^2 \bar{\Phi}}{\partial x^2} +$$

$$+ \frac{2}{f} \frac{\partial}{\partial y} \left\{ \frac{\partial \Phi}{\partial x} \cdot \frac{\partial \Phi}{\partial y} \right\} - \frac{R \zeta}{f} \frac{\partial}{\partial x} \left( \frac{1}{c_p \rho} \right) = F(\zeta).$$

The eigenvectors of the components of the ageostrophic wind are compared. Orig. art. has: 24 equations, 1 graph, and 6 tables.

TITLE: Statistical relation between vertical profiles of various meteorological elements.

12

SOURCE: Meteorologiya i gidrologiya, no. 12, 1965, 37-40

TOPIC TAGS: meteorology, correlation statistics, atmospheric pressure, atmospheric temperature, wind

ABSTRACT: In this work the author attempts to obtain the optimal representations of vertical profiles of pressure, temperature, and wind, and to establish a relationship between them. For this purpose the vertical temperature profile is represented in a mathematical form which encompasses the climatic norm and the coefficients of expansion. The system of optimal functions of the temperature is based on data on the interlevel correlation of the deviations of temperature from the climatic norm. The optimal system of functions is given in tabular form. To set up the optimal representations of the vertical geopotential profile the author expresses the geopotential at a certain level in terms of temperature and average geopotential of the layer and gives the mathematical formula for this

Card 1/2

ACC NR: Ap6009788

2

expression. The author compares the calculated vectors of the expansion of the geopotential and wind field with the optimal system of functions of the wind field in the first and second approximations. The comparison shows that the first vector for the geopotential and wind profiles can be sufficiently accurately determined even with a one-parameter representation of the temperature profile. The first approximation to the value of the second eigenvector of the wind field is fully satisfactory almost everywhere except for the 200 mb surface. Consideration of the second parameter of the temperature field corrects this lack, so that the same representation of the wind and geopotential profiles corresponds to a 2-parameter representation of temperature. Thus, by limiting himself to two parameters in the representation of the basic fields of meteorological elements, the author can describe only 3/4 of the dispersion of the temperature field and more than 9/10 of the dispersion of the geopotential and wind fields. As a result, the solution of the problem of integration in time of the initial equations of atmospheric dynamics can be appreciably simplified. The author expresses his sincere thanks to Professor M. L. Yudin for his valuable advice and instructions in performing the study, and also to L. V. Rukhovets for his attention. Orig. art. has: 6 formulas, 3 tables and 1 figure.

TITLE: Contributions to the calculation of the deviation of the wind from geostrophic in the planetary boundary layer of the atmosphere

SOURCE: AN UzSSR. Seriya fiziko-matematicheskikh nauk, no. 4, 1966, 21-25

TOPIC TAGS: atmospheric wind field, atmospheric stratification, geostrophic wind, turbulent boundary layer, computer program, wind velocity, synoptic meteorology

ABSTRACT: The wind deviations are calculated for the case of an even terrain, when the ageostrophic wind in the boundary layer is connected essentially with the force of turbulent friction. It is then possible to calculate the ageostrophic wind on the lower limit of the atmosphere by using the solution obtained by S. S. Silitinkevich et al. (in: Materialy Sevostopol'skogo simpoziuma 1964, Kiev, Naukova Dumka, 1965) for the nonlinear system of equations of turbulent motion for neutral stratification. An appropriate algorithm was constructed and programmed for the Ural-4 electronic computer. The pressure field was obtained at 333 points of a triangular grid, and the components of the geostrophic wind were calculated for 263 points, at which the values of the aerodynamic roughness of the underlying surface were also specified. All the quantities were referred to a level of 975 mb, corresponding to a height of 200 m.

Card 1/2

L 07873-67

ACC NR: AF6030663

Comparison with published results by others disclosed a considerable influence of the underlying surface on the character of the wind. The average deviations of actual wind from geostrophic did not exceed 10% of the mean value of the geostrophic velocity. In all cases, the actual wind was on the average smaller than geostrophic. At levels 850 and 700 mb, in most cases the actual wind velocity was larger than geostrophic, but the opposite was observed at 500 mb. A map of the corresponding synoptic situation in the fields of the zonal and meridional components of the ageostrophic wind for a certain date are presented. Comparison of the field of the ageostrophic wind with the synoptic situation shows good correspondence between the zones of the maximum values of these deviations with the zones of condensation of the isobars. It was observed that at identical wind velocities, the deviation was larger over dry land than over the sea. Orig. art. has: 3 figures, 2 formulas, and 1 table.

TITLE: Effect of 5-metoxytryptamine on skin changes induced by ionizing irradiation of mice and rats

SOURCE: Meditsinskaya radiologiya, v. 9, no. 3, 1964, 70-74

TOPIC TAGS: radioprotective preparation, 5-metoxytryptamine, radioprotective action, total X-irradiation, local beta-irradiation, large dose beta-irradiation, skin change, hair follicle, hair growth, hair follicle connective tissue, hair follicle epithelium, cell regeneration

ABSTRACT: To test the effectiveness of 5-metoxytryptamine radioprotective action, one group of 59 black mice was exposed to total X-irradiation of 700 r (RUM-11 unit, 180 kv, 10 ma, focal length 30 cm, 33 r/min) and another group of 18 white mice was exposed to local irradiation of the spine (65X23 mm section) with beta rays ( $Ce^{144}$ , 500,000 erg/cm<sup>2</sup> dose for 11 min). Ten min before irradiation half of the mice in each group were injected intraperitoneally with .04 ml 5-metoxytryptamine in a physiological solution

Card 1/32

ACCESSION NR: AP4025124

(75 mg/kg), and the other half of each group was injected with only the physiological solution. The animals were killed 1, 3, 5, 7, 15 and 30 days after irradiation for histological examination of hair follicles and skin layers. It was found that total X-irradiation affects the epithelial part of the hair follicle, and local beta irradiation in large doses affects the connective tissue as well as the epithelial part of the hair follicle. The radioprotective action of 5-metoxytryptamine with both types of radiation is indicated by the later appearance of hair follicle radiation damage in less severe form and by earlier regeneration of cells. Reaction of skin and hair growth to irradiation is suggested as a convenient and fast method for testing the effectiveness of radioprotective preparations. Orig. art. has; 2 figures.

SOURCE: AN UzSSR. Izvestiya. Seriya tekhnicheskikh nauk, no. 3, 1965, 85-87

TOPIC TAGS: matrix eigenvalue calculation, matrix eigenvector calculation, eigenvalue program, computer programming, eigenvector program

ABSTRACT: During determinations of the frequencies and free oscillations of rod mechanisms, one often encounters eigenvalue-type systems of algebraic equations  $(A - \lambda E)X = 0$  where A and E are matrices, and X is an eigenvector associated with the eigenvalue  $\lambda$ . This brief note presents a program for the evaluation of the eigenvectors and eigenvalues using the iteration and exhaustion approach (see D. K. Faddeyev, V. N. Faddeyeva, Vychislitel'nyye metody lineynoy algebrы, M.-L., 1963). The program can handle secular matrices up to the 57th order, inclusive, and the error of the solution is  $10^{-11}$ . The block diagram of the program and an illustrative example are given. 212 characters of formulas.
