TITLE: Some photoelectric properties of monocrystals of n -CdGeP₂ and
p-ZnGeP₂

SOURCE: Fizika i tekhnika poluprovodnikov, v. 1, no. 1, 1967, 141-143

TOPIC TAGS: vapor pressure, photoelectric property, germanium single crystal,
single crystal growing, IR photoconductor

SUB CODE: 20

ABSTRACT: The vapor pressures of all three components in the compounds tested
in this article differ sharply. This makes the technology of production of
monocrystals extremely complex, which explains the complete absence of informa-
tion on the physical properties of these compounds in the literature. Using
dual temperature synthesis, the authors developed a technique for synthesizing
these compounds in consideration of the pressure kinetics of the vapors in

Card 1/2

0933 0842

ACC NR: AP7013140

an ampule. The CdGeP₂ monocrystals were produced by directed crystallization from a stoichiometric melt at constant temperature gradient. This same method was used to produce crystals alloyed with tin, germanium, gallium, arsenic, bismuth and indium. The ZnGeP₂ monocrystals were produced by crystallization from a melt-solution. The first measurements of photoconductivity of these monocrystals showed that they have maximum photosensitivity in the visible and near infrared areas, which will possibly determine the area of their practical application. Plastically Deformed

PERIODICAL: V sb.: Materialy 8-y Nauchn. konferentsii professorsko-prepodavat.
sostava Fiz.-matem. fak. (Kirg. un-t), Frunze, 1959, pp. 67-68

TEXT: The dependence of the grain size at annealing temperatures from 300 to 600°C on the degree of compressive strain (from 1 to 84%) was studied radiographically at Al specimens of the A00 brand. The observed maximum of the grain size at 20-30% deformation for the frontal specimens surface and 9-18% for the lateral surface is explained by the fact that the setting process of units and parts of grains and the cumulative recrystallization of units and grains intensely proceed at these deformation degrees. Moreover, a maximum of the grain size was observed at 70-84% deformation. A strongly tessellated coarse-grained structure

ABSTRACT: The microhardness (H_μ) of Al of the A00 grade was measured under a load of 50 g after the specimen has been subjected to static compression with subsequent annealing at temperatures of 350-600°C. It is shown that after annealing the H_μ is independent of the degree of deformation to which it had been previously subjected and that it diminishes with increasing temperatures of anneal.

Title : ~~_____~~ Natural and trophic interoreceptive reflexes and immunobiological reactions of an organism

Periodical : Zhur. mikro, epid. i immun. 7, 24-33, Jul 1954

Abstract : The effects of glucose and ten amino acids (phenylalanine, glycine, triptophan, lysine, "ascorbic acid", cysteine, glutamic acid, tyrosine, histidine, norleucine) which act as natural-trophic stimulators of the interoreceptors of the blood vessels, and affect nutrition and the immunobiological reactions of an organism, were investigated in detail. The effects of typhoid fever bacteria in this capacity were also studied. The results of the investigations are presented on eight charts. Four Soviet and two pre-revolutionary Russian references are cited.

TOPIC TAGS: geologic survey, geologic prospecting, map

ABSTRACT: Regional geophysical surveys are conducted in Kazakhstan to divide the territory into tectonic regions, to study its plutonic structure, and to solve some problems of geophysical mapping. The results of these surveys will make it possible to establish structural belts and regions in which minerals are likely to be found. The basic material will be obtained from investigations of the magnetic and gravitational fields in combination with seismic studies. In the magnetic and gravitational fields, tectonic and plutonic seams are isolated which correspond to terraces in the

TITLE: Studies of the influence of lubricants and surface finishing on the pressure during backward cold extrusion of steel

SOURCE: Kraków. Akademia Górnictwo-Hutnicza. Zeszyty naukowe. no. 37, 1961. Metalurgia i odlewnictwo. no. 7, 93-145

TEXT: The present study was primarily aimed at determining the usefulness of certain lubricants and surface machining for the backward cold extrusion of steel and some non-ferrous metals. Cups of mild carbon steel H-84019 were extruded, using hardened chromium steel tools, and a variety of surface finishes (flat die forging, rolling, rough grinding, fine grinding, polishing, flame galvanizing, electro-galvanizing, bonderizing) and lubricants. With carefully polished tools, in contrast to expectation the extrusion pressures were found to be higher when the steel had a very smooth surface;

Studies of the influence ...

grooved surfaces which could hold the lubricant required lower pressures and bonderizing reduced the pressure only slightly (by 1-5%). Electrogalvanizing was practically equivalent to bonderizing in its effect on the pressure, while flame galvanizing was inferior. Of the 50 lubricants tried, the best results were obtained with mixtures of vegetable or animal fats with graphite, and with K soap mixed with graphite and a small amount of rape oil. Reasonable results were also obtained with a cheap lubricant consisting of K soap, water, and a little tallow or rape oil. The above mixture could also be used when the semi-finished products covered with it were dried, making for very clean working conditions.

There are 8 figures and 27 tables.

A-22-III (A-22-III) radiosonde

PERIODICAL: Meteorologiya i gidrologiya, no. 9, 1960; 35-38

TEXT: Since 1958, the new A-22-III (A-22-III) radiosonde has been introduced in several points of the aerological network of the USSR. Design and evaluation method of the signal recordings of this instrument were described by V. A. Pobiyakho (Ref. 2: Zondirovaniye atmosfery radiozondom A-22-III. (Sounding of the atmosphere with the aid of the A-22-III radiosonde) Meteorologiya i gidrologiya, no. 8, 1959). Some suggestions regarding improvement of the evaluation method of signal recordings submitted to the Tsentral'naya aerologicheskaya observatoriya (Central Aerological Observatory) are presented. In 1959, eight such suggestions were presented, four of which can be classed in one group: by S. A. Budarina, UGMS Uzbekskoy SSR (UGMS of the Uzbekskaya SSR), G. A. Vesnitskiy, Verkhne-Volzhskoye UGMS (Upper Volga UGMS), N. M. Akimov, UGMS Ukrainskoy SSR (UGMS of the UkrSSR),

4

and A. S. Ochkovskiy, UGMS Latviyskoy SSR (UGMS of the Latviyskaya SSR). In all these suggestions, the copies of the calibration curves are to be drawn on special celluloid or plexiglass rulers or on the chart of the semi-automatic signal recorder of the radiosonde. S. A. Budarina suggests printing the certificate forms on transparent paper on the scale of the chart and using a special ruler of transparent material till such forms will be printed. Before the ascent of the radiosonde, the data of the temperature and humidity calibration curves are transcribed with Indian ink from the certificate to the ruler. For reading, the ruler is shifted till the ruler scales coincide with those of the chart. The values of the meteorological elements are read at the intersections of the chart curves with the corresponding calibration curves on the ruler. G. A. Vesnitskiy suggested 2 transparent special rulers: a main ruler (Fig. 1a) and an auxiliary ruler (Fig. 1b), both $350 \times 400 \times 2$ mm. Further subdivision is made with the aid of the triangle of division (Fig. 1b). The auxiliary ruler serves for the speedy performance of some operations in the signal evaluation and has 3 scales and one nomograph. Scale 1 serves for the plotting of altitude marks and for the reading of altitudes from the curve on the chart. Scale 2 serves for determining the vertical speed of the sonda, scale 3 for plotting

Card 2/8

B116/B217

Ways to improve the evaluation ...

the pressure marks on the chart and nomograph 4 for determining the altitudes of the middle of the layer for evaluation of the wind dates. The method suggested by A. S. Ochkovskiy is only a variety of that by G. A. Vesnitskiy, whereas N. M. Akimov suggested a slide 700×350 mm with limiters and a transparent template. R. O. Tydel'skaya and P. L. Yefimov (TsAO) suggested plotting the evaluation results on the chart. The pressures, the numbers of the scales as well as the actual temperature and humidity values are to be plotted on the synchronous lines (corresponding to the standard pressure values) on the left side of the chart, the altitudes as well as the numbers of the scales for temperature and humidity corresponding to the measured points on the right side of the chart. The altitudes and numbers of the temperature and humidity scales for the standard altitudes are plotted in the middle part of the chart. The actual temperature and humidity values corresponding to the measured points are, however, directly to be entered into the TA3-3 (TAE-3) table. Parallel curves are plotted on the temperature and humidity calibration curves before the ascent of the radiosonde in order to simplify the evaluation. It is recommended to enter the different calibration data and all necessary characteristics into the rear side of the certificate form (special forms), which renders the TA3-4a(TAE-4a) table

Ways to improve the evaluation ...

superfluous. The use of the slide designed by R. O. Tydel'skaya and T. M. Kulinchchenko (Fig. 2) for the evaluation of the signals of the A-22-III radiosonde makes the approximation calculations and intermediate operations superfluous. The calibration curves must be drawn separately on the scale of the chart for pressure, temperature, and humidity (by manufacturers). The templates of the calibration curves for these three elements are added to the slide. On reception of the signals the chart is stripped between the limiters 2 (Fig. 2). The pressure, temperature, and humidity curves are plotted on the chart, then template 6 with the calibration certificate is placed into the recess of the slide. Then ruler 4 with the carriage is shifted toward the standard pressure values (900, 850, 800 mb etc.) on the certificate and a point drawn at the intersection of the pressure curve on the chart with the ruler. This point is encircled and denoted by 900, 850 mb respectively, etc. The templates with the temperature and humidity calibration curves are used in the same manner. S. A. Porchkhidze (TsAO) suggested an improvement of the signal evaluation. There are 2 figures and 2 Soviet-bloc references.

S/050/60/000/009/004/008
B012/B063AUTHOR: Tydel'skaya, R. O.TITLE: Ways of Improving the Method of Interpreting Signals
Emitted by an A-22-III (A-22-III) Radiosonde ✓

PERIODICAL: Meteorologiya i hidrologiya, 1960, No. 9, pp. 35 - 38

TEXT: The new A-22-III (A-22-III) radiosonde has been put into operation at a number of points of the aerological network of the USSR since 1958. Construction and interpretation principle have already been described in the paper of Ref. 2. Various suggestions addressed to the Tsentral'naya aerologicheskaya observatoriya (Central Aerological Observatory) for a better interpretation of signals are described in the present article. Eight such recommendations were received in 1959. Four of them, which were submitted by S. A. Budarina, UGMS Uzbekskoy SSR (UGMS of the Uzbekskaya SSR); G. A. Vesnitskiy, Verkhne-Volzhskoye UGMS (Upper Volga UGMS); N. M. Akimov, UGMS Ukrainskoy SSR (UGMS UkrSSR); and A. S. Ochkovskiy, UGMS Latviyskaya SSR (UGMS Latviyskaya SSR), can be included in one group. In all of these suggestions, the calibration curve

copies are either to be worked out on special celluloid or plexiglass rulers, or on the tape of the semiautomatic signal recorder of the radiosonde. The recommendations are individually discussed in greater detail with the aid of the ruler shown in Fig. 1. Suggestions by R. O. Tydel'skaya and P. L. Yefimov (TsAO) are described next. According to them, the interpretation results should be recorded on a tape, and the recording is described in greater detail. R. O. Tydel'skaya and T. M. Kulinchenco suggested the carriage shown in Fig. 2 to be used for signal interpretation. The use of it enables one to dispense with preliminary calculations and intermediate operations. The carriage operation is explained with the aid of Fig. 2. Finally, the method suggested by S. A. Porchkhidze (TsAO) for improving the accuracy of the signal interpretation method is briefly described. This method involves the use of tables. There are 2 figures and 2 Soviet references.

TITLE: Medical betatron

PERIODICAL: Technické noviny, no. 27, 1960, 5

TEXT: The first Czechoslovak therapeutical betatron prototype will be installed at the university clinic in Hradec Králové to be used for treatment and prevention of malignant tumors. Engineer Jaroslav Hanuš of the Krajský projektový ústav (Regional Design Engineering Institute) in Hradec Králové was put in charge of designing the betatron building. In addition to a physical laboratory and an irradiation room, the building will receive special equipment produced by the národní podnik Chirana (Chirana National Enterprise) in Prague. The circumferential walls will be up to 1.5 m thick to prevent penetration of radiation to the outside. A special door to the building, weighing several hundred kg, will be electrically operated. The observation window, weighing nearly 600 kg, has been produced in the USSR. The window frame weighs also 600 kg. [Abstracter's note: Essentially complete translation]
