TITLE: The 16th Congress of the Society of Polish Geodesists

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 12, 1962, 5,
abstract 12026 ("Przeegl. geod.", 1962, v. 34, no. 7, 295.- 303,
Polish)

TEXT: The 16th Congress of the Society of Polish Geodesists was held at Lublin on April 8 - 10, 1962. It was attended by 124 representatives from all provincial branches of the Society. The following reports were read at the Congress: B. Szmielew, Chairman of the Main Administration of Geodesy and Cartography, "Technical progress in the state geodetic service" (see abstract 12027); B. Lipiński, Head of the Geodesy Department of the Ministry of Municipal Economy, "Tasks of geodetic service in municipal economy" (see abstract 1203); W. Ploski, Chairman of the Main Board of the Society of Polish Geodesists, "Problems before the Society of Polish Geodesists". (see abstract 1207). In speeches of delegates main attention was paid to necessity of technical progress in the field

of geodesy, which is connected with raising qualifications of geodesists in photogrammetry, electronics, modern methods of reproduction and problems of regional planning. The magazine of the Society "Przegląd geodezyjny" must play an important role in propaganda of technical progress. It was pointed out that a raise of qualifications of specialists must be accompanied by a raise of salaries. A fuller utilization of scientific-technical information becomes necessary. Geodetic youth was very active in the work of the Congress. During the Congress an exhibition of geodetic works was organized, completed at the territory of the Lublin province, and of works awarded prizes at the All-Poland competition of quality. (Honorable gold and silver decorations of the Main Technical Organization of Poland were handed over to 15 members of the Society and the Corresponding Member of the Society, N. I. Modrinskiy, (USSR), awarded for the active work in the Society. Editorial).

AUTHORS: Baran, Václav and Tymp, Milan
TITLE: Determination of free uranyl in a hydrolyzed solution of perchlorate
PERIODICAL: Jaderná energie, no. 1, 1963, 19

TEXT: This is a summary of a work carried out at the Czechoslovak Academy of Sciences, Report no. UJV/632. Knowledge of the concentration of the free uranyl cation was used in the study of hydrolysis: in certain cases this quantity was determined polarographically on the basis of the reduction $UO_2^{2+} + e^- \rightleftharpoons UO_2^+$. It was found that this reaction is independent of pH and that negligible disproportionation of UO_2^+ occurs during the measurement. If the total U- content is higher than the usual polarographic concentration, free UO_2^{2+} may be determined immediately after dilution, down to 10^{-3} or less. ✓

AUTHORS: Maly, Ya., Peka, I., Talash, M. and Tympl, M.

TITLE: Reaction of plutonium dioxide with acidic ammonium fluoride in the absence of water

PERIODICAL: Radiokhimiya, 1961, Vol.3, No.2, pp.195-198

TEXT: Plutonium tetrafluoride is used for the preparation of metallic Pu. The described method consists in the fluorination of plutonium dioxide with ammonium fluoride in the absence of water and is analogous to the method of preparation of uranium tetrafluoride (Ref.5: J.Van Impe, Chem.Eng.Progress, 50, 5, 230 (1954)). A weighed quantity of plutonium dioxide is mixed in a 0.2 ml platinum crucible (Fig.3) with a 20 - 50% stoichiometric excess of re-crystallized and dried ammonium fluoride. The reaction mixture is heated in a vertical furnace to a previously determined temperature at which it is kept for 30 minutes; then the crucible is weighed. The starting temperature is 70°C, the end-temperature 350°C. The temperature is measured with a Pt/Pt-Rh thermocouple. The entire set up is placed in a glass casing through which argon is bubbling. The plutonium is determined by weighing the PuO₂ formed during the calcination of the

Reaction of plutonium ...

corresponding fluorides in the crucible at 600 - 700°C; the employed analytical methods of determination of F and NH₃ are those described by J.Rodden (Ref.6: Analytical chemistry of the Manhattan project. McGraw-Hill Book Co., INC (1950)) and P.Kirk (Ref.7: Quantitative Ultramicroanalysis, N.Y. (1950)). The obtained results were checked by control experiments by the Debye-Scherrer X-ray method. Thermo-gravimetric tests on the PuO₂ - NH₄HF₂ mixture yielded the temperature-time dependence during experiments with 20 to 50 mg of this mixture. The thermo-gravimetric curve and results of chemical analyses showed the temperature range of stability of these compounds:

NH ₄ PuF ₅ · 2H ₂ O	110-125°C
NH ₄ PuF ₅	160-200°C
PuF ₄	250-270°C

A

These results define the temperature conditions of fluorination. It is concluded that the reaction mechanism is as follows:

TITLE: Resistance of staphylococci to HgCl₂ sub 2 as a criterion of their epidemic properties

SOURCE: Przegląd epidemiologiczny, v. 19, no. 3, 1965, 315-319

TOPIC TAGS: bacteriology, penicillin, tetracycline, streptomycin, epidemiology

ABSTRACT: 938 strains of Staphylococcus aureus sampled from hospital environment and germ carriers were tested for their resistance to HgCl₂. 433 of coagulase-positive determined type phages were found resistant to HgCl₂ (46 percent). Within the group of strains resistant to penicillin, tetracycline, streptomycin and to a combination of three antibiotics, the number of HgCl₂-resistant strains was significantly greater than that of the HgCl₂-sensitive strains. The greatest number of strains resistant to HgCl₂ could be indicative of epidemic properties of coagulase-positive staphylococci. Orig. art. has: 1 table.

490. SERUM PROTEINS IN WOMEN DURING LABOUR AND DURING THE INITIAL PERIOD OF PHYSIOLOGICAL PUERPERIUM - Białka surowicy krwi kobiet w okresie porodu i na początku fizjologicznego połogu - Tynecki J., Boczkowski Z. and Rein M. II. Klin. Poloznictwa i Chor. Kobięc. Ak. Med., Lublin - POL, TYG. LEK. WIAD. LEK. 1959. 14/6 (252-254)
Graphs 4 Tables 6

Investigations of serum proteins and their physiological pattern during labour and puerperium may be of importance for diagnosis in cases of complications. Forty-seven cases of women in labour or in the first 24 hr. of puerperium were investigated. Blood samples were taken 4 times: at the beginning of labour, following delivery and 6 and 24 hr. later. Total proteins and protein fractions were determined. The results indicate that during parturition the serum protein pattern changes. The degree of these changes is influenced by blood loss. During the initial period of the puerperium further changes occur, particularly in the γ -globulin fraction.

"Effect of Early Interruption of Pregnancy on Blood Sugar Level, Circulation, and Respiration."

Warsaw-Krakow, Przegląd Lekarski, Vol 19, Ser II, No 3, [24 Mar] 63, pp 180-181.

Abstract: [Authors' English summary] The authors examined the blood sugar level, as well as the circulation and respiration in 200 cases of early interruption of pregnancy with the use of various anaesthetics. The results of their investigation indicate that women should be hospitalized for abortions and that it is absolutely necessary for the operation to be painless. Of the 14 references cited only one is German and the others Polish.

TYNGACHINA, Z.M.

99. Q Fever Found in Infectious Hepatitis Foci

"The Diagnosis of Q Fever in Infectious Hepatitis Foci," by F. G. Dardik and Z. M. Tyngachina, Zdravookhraneniye Kazakhstana, No 12, Dec 56, pp 42-45

The article states that despite the fact that Q fever has been reported throughout the USSR, i.e., the European part, the Transcaucasus, Central Asia, and Kazakhstan, the epidemiology, clinical manifestations, pathogenesis, and laboratory diagnosis of this disease have been studied insufficiently. Since its route of entry into the human organism is the same as that of other pathogenic diseases, i.e., dysentery, typhoid fever, poliomyelitis, and infectious hepatitis, it was decided to study the coexistence of these diseases in places where they were most widespread.

In 1955 and 1956 in an industrial city, a number of cases of infectious hepatitis occurred, 59.7% of the cases occurring between October and February. Outbreaks occurred in families, schools, nurseries, kindergartens, and dormitories. The majority of the patients, 57%, were between the ages of 16 and 30. This outbreak was followed by a number of cases of a febrile disease which was diagnosed as virus influenza. The clinical manifestations and treatment of both diseases are described.

Dried specimens of blood were obtained from 81 patients, put into solution, and subjected to complement fixation reactions with either *Rickettsia burnetti* antigens or other rickettsial antigens. Of the 57 specimens reacted with *R. burnetti*, 31 gave positive reactions.

It is recommended that complement fixation reactions with *R. burnetti* be carried out in any locality where there is a mass outbreak of a febrile disease and that if the reaction cannot be carried out locally, dried blood specimens be dispatched to a central laboratory. (U)
