AUTHOR: Tynyanskiy, N. T.

TITLE: The Extension of the Duality Law of K. A. Sitnikov to the Case of Sets Lying in Manifolds Which do not Satisfy the Acyclicity Conditions

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki, mekhaniki, astronomii, fiziki, khimii, 1959, No. 5, pp. 21-31

TEXT: K. A. Sitnikov (Ref. 1, 2) denoted as a true cycle $Z^q = \{z_k^q, x_k^{q+1}\}$ of the set B a sequence of ϵ_k -cycles z_k^q situated on a compactum $\varphi \subseteq B$ and ϵ_k -chains x_k^{q+1} which satisfy the following conditions:
1.) $\epsilon_k \rightarrow 0$ for $k \rightarrow \infty$ 2.) $\Delta x_k^{q+1} = z_{k+1}^q - z_k^q$. There he considers strong homologies and groups $\Delta^p A$. The author applies these notions and proves the theorem: Let M^n be a closed, orientable homological n-dimensional manifold, let A be a set in M^n , $B = M^n \setminus A$, p and q nonnegative integers, $p + q = n - 1$. Then the group $\Delta^q(B; M^n)$ is

The Extension of the Duality Law of K. A. Sitnikov to the Case of
Sets Lying in Manifolds Which do not Satisfy the Acyclicity Condi-
tions

isomorphic to the group $\nabla^p(A;M^n)$. Here $\Delta^q(B;M^n)$ is the factor
group of the group of all q-dimensional true cycles with compact
carriers in B which are homologous to zero in the whole manifold
 M^n , with respect to the subgroup of the q-dimensional true cycles
which are strongly homologous to zero in B. The group $\nabla^p(A;M^n)$
is the factor group of the group $\nabla^p A$ with respect to the subgroup
 $\nabla_k^p(A;M^n)$ which is defined with the aid of finite coverings of M^n
and which consists of certain equivalence classes.
If M^n is acyclic in the dimensions q and q + 1, then $\Delta^q(B;M^n)$ and
 $\nabla^p(A;M^n)$ are transformed into $\Delta^q B$ and $\nabla^p A$ and the theorem
changes over into the duality theorem of Sitnikov.

ABSTRACT : When any given pea strain is grafted on other
 pea strains the successful taking of the graft
 depends on the presence of nutritive substances
 in the seedlobes of the wilding. A still
 greater influence of the wilding on the graft
 is observed if the wilding is raised in the
 field to the age of 5-6 days after sprouting,
 while the scion is raised in a laboratory until
 it reaches the size of 0.5 - 1 cm. When peas
 with angular seeds (recessive indicator) are
 grafted on a wilding with smooth skin (dominant

ABSTRACT : indicator), the form and the size of the seeds change. In most plants, however, as in the primary strain of the scion, the seeds become angular again in succeeding generations. Plants with smooth seeds were selected. In generations grown from such seeds, changes of stem height, of the pea's form and size, of the seed size, of the vegetation period's duration, etc. were observed. New pea strains were obtained which exceeded local strains in their yields.

Results of surgical (palliative) treatment of cancer of the breast by simple mastectomy and irradiation ACTA UNIV. PALACK. OLOMUCENSIS 1955, 7 (137-154) Graphs 8 Illus. 2

The authors are against radical surgical operations which mutilate the patient without being able to prevent further dissemination of the disease. Instead, palliative simple mastectomy with post-operative irradiation is advised. Statistical results of the 1948-1955 period comprising 116 personal cases are presented and a detailed description of irradiation technique is given. 73% of patients operated upon in the first stage and 42.5% in the second stage survive for 3 yr.; 50% of the patients operated in the first stage and 33% in the second stage survive for 5 yr. after the operation.

TITLE: Manufacture of tubes from new ferritic martensitic heat
resistant steels

SOURCE: Stal', no. 3, 1964, 258-263

TOPIC TAGS: heat resistant steel, steel tube, ferritic martensitic
steel, tube rolling

ABSTRACT: The authors report on techniques developed in recent years
by the Ukrainskiy n.-i. trubny*y institut (Ukrainian Tube Research
Institute) in cooperation with tube factories in Pervoural'sk and
Nikopol for hot rolling and heat treating of tubes made from 9 new types
of steel, all of which contain 10—14% Cr and additions of V, Mo, Nb,
and W. The AC temperature was in the range of 810—830C; ferrite
grain growth was noted above 1100C; piercing temperatures varied from
1090 to 1200C. Ductility at high temperatures was found to depend on
the content of free ferrite, and piercing of tube billets presented no

Card 1/2

ACCESSION NR: AP4019481

difficulties at a content of 50%. At 15—20% ferrite hot tears, cracks, and laps were formed. Annealing of hot-rolled and reduced tubes at 770—780C imparts a structure of granular pearlite and the mechanical properties needed for further cold reduction. Metal consumption for almost all steels, including machining, proved no higher than those for similar pipes of stainless steels in current production practice. "Engineers N. S. Kirvalidze, R. A. Prudkova, N. N. Pil'nikova, L. S. Rakhnovetskiy, I. S. Pechennikova, and others took part in the work." Orig. art. has: 8 figures and 2 tables.

TITLE: A Method of Measuring Inside Tube Diameters by Means of an Electric Internal Gage.

PERIODICAL: Izmeritel'naya tekhnika, 1960, Nr 2, pp 6-7 (USSR)

ABSTRACT: The described instrument^A (Photo) can measure the inside diameter of tubes over the entire length, which is not possible with conventional "go" gages and other measuring tools used in industry. The first model is only applicable for research, but it can be provided with a centering device and made usable in plant shops. The instrument consists of the following parts: two leaf springs fixed inside the body, vertically displaceable pins "feeling" the inside tube diameter and exerting a pressure upon the spring, resistance wire transmitters pasted to the leaf springs on their tops and bottoms, and a resistance bridge which is brought into disbalance by these

TITLE: Classification and Formulation of Pipe Standards
(Klassifikatsiya i postroyeniye standartov na truby)

PERIODICAL: Standartizatsiya, 1958, Nr 3, p 66 (USSR)

ABSTRACT: The authors make suggestions for the classification and stipulations of new standards for pipes, in reference to the standards "GOST 8731-58-8734-58" which come into effect on 1 Jan 1959. The suggested classification is illustrated. There is one figure.

"Outbreak of Poisoning with "Dieldrin" Insecticide on a Ship."

Warsaw, Przegląd Epidemiologiczny, Vol 16, No 3, 62, pp 315-320.

Abstract: [Authors' English summary] An intoxication outbreak on a foreign ship in Gdansk was reported. Some members of the crew suddenly fell ill, and at first gastroenteritis due to bacteria was suspected. Epidemiological enquiries and laboratory tests confirmed intoxication due to "Dieldrin." Control and prophylactic measures, as well as a clinical picture of the intoxication are presented. Of the eight references, two are Polish, and six are American and WHO.

AUTHORS: Palatnik, L.S., Kosevich, V.M. and Tyrina, L.V.
TITLE: Electron Diffraction Studies of the Metastable
Phases in Au-Sb, In-Sb, In-Bi and In-Bi-Sb Alloys
PERIODICAL: Fizika metallov i metallovedeniye, 1961, Vol.11, No.2,
pp.229-235

TEXT: Thin layers of the alloys, prepared by simultaneous condensation of the components at 40°C, were investigated. A new phase was detected in the gold-antimony system (Fig.1 and table 1). It is cubic and its parameter changes from 5.89 to 6.08 Å at 63 to 76 wt.% antimony. It is proposed that the new phase is the compound AuSb₃. It was observed in films 200 to 700 Å thick but not in a film 10 microns thick investigated by X-ray analysis. In the indium-antimony samples, a cubic and a metastable hexagonal form of InSb were observed. Antimony in the amorphous state was also observed. In the indium-bismuth system, a new phase was found between the two stable compounds InBi and In₂Bi. The data for the new phase are given in Fig.2 and table 3. It corresponded to In₃Bi₂ and was found in all films up to 700 Å thick. It was stable up to 90°C where it dissociated into InBi

Card 1/5

✓

Electron Diffraction ...

EO21/E435

and liquid. The ternary antimony-indium-bismuth system was also studied. The stability of In_3Bi_2 and the hexagonal form of InSb was the same in the ternary system as in the binary systems. Antimony in the ternary system could exist either in the amorphous or in the crystalline state. An increase in indium content tended to form amorphous antimony. The authors constructed a topological structure diagram for the ternary system; no ternary compounds were observed. There are 3 figures, 3 tables and 12 references: 8 Soviet and 4 non-Soviet. ✓

AUTHORS: Ivanov, V.Ye.; Zelenskiy, V.F.; Stukalov, A.I.; Azarenko, A.V.; Ty*rina, L.V.; Gordiyenko, Ya.I.; Kunchenko, V.V.

TITLE: The relationship between the texture of hardened uranium and the type of heating and other aspects of heat treatment.

SOURCE: Atomnaya energiya, v.16, no.4, 1964, 325-332

TOPIC TAGS: phase recrystallization, heat treatment, uranium treatment, polymorphic transformation, multiple hardening, beta phase, alpha phase, phase transformation, annealed uranium, linear expansion, slow cooling, diffusion conversion.

ABSTRACT: It has now been established that the radiative growth of uranium is largely determined by the nature and prominent features of its texture. An attempt has been made to destroy the uranium texture resulting from a single hardening process by subjecting it to several such processes (up to 4 times). The result was a pulverization of the grain and disappearance of the texture, although the authors claim that the latter requires additional verification. Opinions vary as to

Card 1/2

ACCESSION NR: AP4029694

the best method of hardening uranium with a view to limiting its increasing radiation. The tests made in this connection included hardening the uranium samples in the beta- and gamma-phases, followed by the slow-cooling and water-cooling methods. The test results indicate that the texture of hardened uranium is determined primarily by the parameters of the heat treatment of the metal, and the following conclusions are therefore justified: 1) the texture of hardened uranium depends on the nature of the heat treatment but primarily on the duration of exposure to high-temperature phases; 2) the greatest destruction of the texture was noted in the samples that had been heat-treated under the effect of tensions produced by thermic gradients or external efforts, and 3) in the case of low and moderate heating speeds, the texture of hardened uranium is determined to a large extent by the technology of the uranium production and the duration of its exposure in the beta-phase before the hardening. NOTE: This collection of articles is intended for the general reader interested in the status of scientific studies and research in the Soviet Far East.

CONTENT: These articles review scientific achievements which have contributed to the economic development of the Soviet Far East. The creation of the first scientific center in the Far East and of the Far East Branch of the Academy of Sciences is described. Studies in the history, geology, geophysics, chemistry, biology, and economics of the region are discussed and a great number of scientists and their contributions mentioned. Stress is laid on the progress of the geological survey carried out in the southern part of the Far East and the consequent discovery of coal, silver, lead, gold and petroleum. In addition to studies of the subsurface wealth, works on the vegetation and forest are also presented. Numerous references are incorporated in the text.
