TITLE: The Preparation of Individual Alcohols From Spermaceti Oil

PERIODICAL: Zhurnal prikladnoy khimii, 1959, Vol 32, Nr 10, pp 232<sup>4</sup>-  
2329 (USSR)

ABSTRACT: In the present work is given a new process for the conversion of spermaceti oil into higher saturated alcohols. To initiate the reaction methylisopentanol or ethylcellosolve were used. Spermaceti oil was treated with metallic Na and corresponding alcoholates were obtained. The obtained alcoholates were decomposed with urea. Solid and liquid alcohols were separated in a hydraulic press at 160 atm. and room temperature. The liquid alcohols were distilled under vacuum, and a product with an average molecular weight of 187, mp 22-23°, 258-278°, was obtained. The saponified spermaceti oil was extracted with benzene. The solvent was removed and the residue was separated into solid and liquid products. Vacuum distillation of the liquid product gave a fraction with mp 7°, b.p. 255-285°. The

second distillation gave technical grade alcohols (myristyl and others). Spermaceti alcohols were isolated into the following components: stearyl alcohol 5%, cetyl alcohol 20%, oleyl alcohol 65%, lauryl and myristyl alcohols 10%. From the fatty acids were separated: 10% of C<sub>12</sub>-C<sub>14</sub> and 33% of C<sub>16</sub> acids. The following spermaceti alcohols obtained by reduction with metallic sodium were isolated: stearyl alcohol 4%, cetyl alcohol 30%, oleyl alcohol 26%, lauryl and myristyl alcohols 40%. TITLE: Determination of geographic coordinates of intersection points of hyperbolae (ellipses) on a sphere

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 10, 1962, 35, abstract 106187 ("Tr. Tsentr. n.i. in-ta morsk. flota", 1961, no. 39 18 - 29)

TEXT: Direct calculation of intersection point coordinates leads to cumbersome formulae, poorly suitable for use on electronic digital computers. It is more expedient to determine coordinate from pre-calculated distances  $r_2$  from the central base station to the points of intersection of hyperbolae. The formula is derived for calculating the mentioned distances:

$$B_0 \operatorname{tg}^2 r_2 - 2B_1 \operatorname{tg} r_2 + B_2 = 0 \quad (1)$$

Coefficients  $B_i$  are functions of base lengths, angle between bases and measured

Card 1/2

Determination of geographic coordinates of...

3/035/62/000/010/111/128  
A001/A101

distance differences. Of two values of  $r_2$  obtained from (1), a lesser and positive  $r_2$  will correspond, in overwhelming number of cases, to spherical lune with angle  $\alpha < 180^\circ$ . In exceptional cases ( $\alpha \approx 180^\circ$ ), when calculated  $r_2$ -values are close in magnitude and similar in sign, it is proposed to calculate geographic coordinates from both values of  $r_2$ , and afterwards to determine the actual (corresponding to the observation place) intersection point. It is noted that a spheroidal correction by V. Ye. Ol'khovskiy can be introduced into the formula (reference is absent). An example is given.

TOPIC TAGS: muon, cosmic radiation, calorimeter

SUB CODE: 20

ABSTRACT: A study of high-energy cosmic radiation muons was carried out at an installation consisting of an ionization calorimeter located in a tunnel at a depth of 130 m from the surface and five groups of hodoscopic counters on the surface which recorded showers accompanying the muons. The experimentally determined ionization burst spectrum of the muons could be described by the equation  $T(>k) = T_0 k^{-\gamma}$ , where  $k$  is the magnitude of the burst expressed in an equivalent number of relativistic particles.  $\gamma$  was 2.0 at  $k = 1000-4000$ , which corresponded to  $\gamma = 2.5$  for the vertical flux of muons. The principal contribution to the bursts recorded was made by muons with an energy of  $3 \times 10^{11}$

Card 1/2

ACC NR: AP7007078

$\sim 2 \times 10^{12}$  ev. At a projection angle  $\leq 70^\circ$ , at which no more than two adjacent ionization chambers in the six vertically arranged rows in the ionization calorimeter operated,  $\gamma$  was 2.2. During 765 hours of operations, corresponding to 1100 recorded bursts, the latter were accompanied by broad showers

$(N_e = 5 \times 10^4 - 5 \times 10^5)$  in nine cases. From a statistical standpoint, this result was insufficient for definite conclusions with regard to the correlation between muons and showers. The authors thank E. L. Andronikashvili and G. Ye. Chikovani for their interest and discussions, which greatly helped in the research. Orig. art. has: 4 figures and 1 formula. JPRS: 39,658

Title : A New Method for Measuring the Pressure of the Cerebrospinal  
Fluid

Orig Pub : Vopr. nevrokhirurgii, 1957, No 3, 52-55

Abstract : A compensation principle for measuring the pressure of the cerebrospinal fluid is proposed. An elastic membrane divides a compensator receiver into two chambers. One of them communicates with a needle, and the other with an inflatable balloon, a manometer and an outlet orifice. When the air pressure is turned on, the membrane is deflected from the outlet orifice, and the starting pressure is established in the chamber. The dynamics of the pressure in the air chamber correspond to the fluctuations of the pressure being measured, and are determined by the manometer

2283. CERTAIN PROBLEMS OF CLOSED TRAUMA OF THE SKULL AND BRAIN (Russian text) - Uglyumov V. M. Moscow - VOPR. NEIROKHIR. 1958, 2 (8-15)

It is proposed that closed head injuries include those cases in which there is no damage to the scalp, and also those lesions in which scalp injuries are not accompanied by simultaneous fracture of immediately underlying cranial bones. Cerebral trauma consists of a combination of reversible (functional, of the type of paroxysms or rebound inhibition) and irreversible (chiefly uncompensated morphological) changes in the cortex, subcortex and other parts of the brain. At the same time local and diffuse cerebral involvement becomes associated with widespread pathological changes in various internal organs and physiological systems. One of the main links in the system of reflex reaction in closed head injuries is acute disturbances of circulation both in the brain and various internal organs with subsequent cerebral and pulmonary oedema. Closed trauma to skull and brain should be regarded as a single nosological form with different clinical manifestations. Recognition of contusion of various parts of the base of the brain, in particular the hypothalamic-hypophyseal system, is often made possible only by the use of clinico-physiological and clinico-biochemical methods of investigation. These reveal: (a) diminution of conditioned reflex salivation; (b) transient changes in arterial blood pressure and ECG, in particular the T-wave of the muscle- or coronary-insufficiency type; (c) CSF-urinary antagonism. Following withdrawal of CSF the amount of urine excreted is two-thirds to one half of the amount of ingested fluid; (d) very marked and persistent changes in CSF pressure; (e) very marked subarachnoid haemorrhages and slow disappearance of admixed blood from the CSF; (f) slow wave activity in EEG recorded from the base. Depending on the clinical form and its stage (in the absence of indications for surgical treatment) treatment follows 2 main directions: (1) protective treatment (prolonged physiological sleep, bromides, use of ganglion-blocking agents, hypothermia); (2) stimulating treatment (action through the system of the motor analyzer, medicinal and biological stimulants). Anti-histamine agents ('benadryl', etc.) were used to restore the normal state of the blood-brain barrier.

TITLE:	The Inter-university Scientific Conference on Electrical Measuring Instruments and the Technical Means of Automation (Mezhurosskaya nauchnaya konferentsiya po elektronometrii iym priboram i tekhnicheskim sredstvam avtomatiki)	
PERIODICAL:	Priborostroyeniye, 1959, Nr. 3, pp. 30-31 (USSR)	
ABSTRACT:	<p>This Conference was held at the Leningrad Electricity Electrotechnical Institute (Leningrad Institute of Electrical Engineering) (Leningrad (Leningrad) ) in November 1958. It was attended by more than 500 representatives of universities, scientific research institutes of the OKhN, of universities, scientific research institutes, of the SCh (Special Design Office), of industries and other organizations. More than 30 lectures were delivered in the sessions of this Conference. In opening the Conference M. P. Boroditskiy underlined the outstanding importance of automation and of measuring technique for the development of national economy. N. M. Shunilovich reported on "The Trends in the Development of Methods of Radioactive Control of Production Data" and outlined the extensive possibilities of using radioactive methods in such control.</p>	
<p>Ye. G. Shranker and S. A. Spaktor reported on a new method of measuring heavy direct currents with the help of the nuclear magnetic resonance. M. A. Rosevskiy investigated problems of the application of magnetic amplifiers in automation and in measuring technique. A. V. Petoyev reported on the present-day state on the prospects of automatic control technique. Ye. - Tarypin investigated some peculiar features of the projects offered by automatic pulse systems. The lecture by N. G. Rodynev dealt with problems of stability of discrete automatic systems. V. B. Ushakov discussed the main trends in the development of mathematical analog computers and of computers designed for industrial use. The report by V. S. Ryabikhin deals with an electronic analog correlator for the calculation of correlation functions in the investigation of winds in the ionosphere. B. I. Turgenov reported on the most important methods which guarantee both an active and passive freedom from disturbances in discrete selective systems. Ye. - Savostyanov discussed problems of averaging, differentiation, and balancing by means of time-dependent functions which can be represented by electric signals. V. P. Gulydin investigated new coupling devices with polarized relays. A. V. Frenke and Ye. I. Dushkin reported on instrument transformers for automatic instruments with automatic recording. V. B. Ushakov and N. M. Kopay-dore reported on a computer for the automatic centralised control of production specificities. N. M. Petoyev discussed unusual problems of the theory of automatic measuring instruments with an inverse conversion for the assessment of concomitant quantities. Ye. I.: Tarypin deals with problems of the construction of automatic dc. potentiometers with high accuracy. D. I. Malin discussed a high-precision automatic d.c. bridge for digital computations. The participants in the Conference, however, are not given by the exact wording of the titles, listed below discussed the following subjects (which, however, are not given by the exact wording of the titles):</p> <p>V. A. Ivanov The planning of measuring elements for</p>

unfavourable factors, in comparison with control materials which remained in the laboratory over the same period. In experiments with bacteria 2ml. samples of suspensions of *Escherichia coli*, *Aerobacter aerogenes*, *Staphylococcus aureus* and *Clostridium butyricum* containing 500 million organisms or spores per ml. were sealed in ampoules, and exposed to a space flight of unstated duration; the number of viable individuals after the exposure did not differ significantly from the values for the control samples. A similar experiment was carried out with the T2 phage of *E. coli* and the 1321 phage of *A. aerogenes*, which were sent in the second satellite; again, no significant reduction in the titre of the phage preparations could be detected after return from space. Similar results were obtained with preparations of phage sent into space in the fourth and fifth satellites. Two bottles and six tubes of HeLa cells, some of which were saturated with oxygen, were exposed to space flight

Card 2/5

The results of the . . .

conditions, after it had first been shown that vibration and acceleration did not detach the cells from the glass. The cultures without oxygen appeared normal on return, whereas in those exposed to oxygen most of the cells had degenerated. Subculture showed that 90% of the cells, whether detached from or remaining on the glass, were dead; however, two tubes gave good growth, and the cells which grew up showed no abnormalities of morphology. No antigenic differences could be detected in the cells in anaphylaxis and desensitization experiments in guinea-pigs. In subsequent space flights fibroblast and human amnion cell cultures were studied, with similar results. Pieces of human and rabbit skin were also used. On August 12th 1960 two pieces of skin 2.5 x 3.5 cm. in size and 0.5 mm. thick were taken from a human donor, placed in Hanks solution and sent into space in the second satellite. On recovery they were regrafted on the original site in the donor and became firmly attached after seven days.

Card 3/5

17

The results of the ---

S/560/61/000/011/007/012  
E027/2635

Similar results were obtained with two other donors. An apparatus was devised for making a subculture in space, in order to study the ability of bacteria to multiply under space conditions. In experiments with *Glostridium butylicum* no deviations from the controls were observed. The second part of the work was devoted to a study of possible genetic effects brought about by exposure to space conditions, mainly by looking for the production of auxotrophic mutants and lysogeny in bacteria. The former were detected by inoculation on a layer of minimal medium which was then covered with an overlay of the same medium in order to fix the colonies. When the latter had grown up their position was noted and an overlay of complete medium was then put on, and the colonies which then grew up as a result of the diffusion of essential nutrients were selected as auxotrophic mutants. No such mutants could be found in suspensions of *Escherichia coli* recovered from the second satellite. The experiments on the induction of lysogenic bacteria were carried out on a strain of *E. coli* lysogenized by a  $\lambda$  phage which had been exposed to cosmic

Card 4/5

17

The results of the ---

radiation in the fifth satellite. Free phage particles were removed by adding phage antiserum; after the end of the latent period the action of the antiserum was cut short by diluting 1:100, streptomycin was added to inhibit the host organisms, and the mixture was plated out on the indicator strain in order to count the phage particles produced. The results obtained, considered in comparison with control experiments, provided no evidence of induction by cosmic radiation during a space flight of ninety minutes. No difference was observed in the plaque morphology. No changes could be detected in the chemical and physical properties of calf thymus deoxyribonucleic acid recovered after a space flight. The results as a whole indicate that no damage was suffered by isolated cells during a brief exposure to space conditions. There are 6 figures and 10 tables.

rate at constant ambient temperatures ( $\approx + 10^{\circ}\text{C}$  with respect to the set zero temperature). The instruments were designed at the Department of the Analogue Computer Techniques of the LETI im. V. I. Ul'yanov (Lenin) on the closed-loop system principle. A block diagram of the computer is given in Fig. 1. It consists of three main units (shown by dotted lines). Unit 1 - a pulse width modulator; 2 - pulse amplitude divider; 3 - a voltage difference amplifier. Operation of the circuit is briefly discussed and sources of errors are determined. The carrier frequency in the described arrangement was 2 - 5 kc/s. Higher frequencies lower the accuracy owing to increased pulse distortion. Emitter followers are used as buffer stages throughout. Requirements as to the integrating networks are stated to be non-critical which makes it possible to use passive RC-networks for this purpose. The d.c. amplifier is a three-stage balanced one with a cathode follower output, overall gain 1000, with series-connected complementary transistor stages. The requirements as to the characteristics of transistors for a multiplier-divider arrangement may be summarized as follows: a) High operating voltages; b) large  $\beta$ ; c) high  $f_T$ ; d) small  $I_{\text{c}}$ .

D201/D301

Filters  $F_1$  and  $F_2$  are used for averaging the pulse output of transistor switches  $K_1$  and  $K_2$ . These consist of simple RC-networks with time constants which may be, in general, different for  $V_1$  and  $V_2$  channels. The transistors used are of the p-n-p type П16 (P16) in pulse stages and type П13A (P13A) in amplifiers. N-p-n type П9 (P9) were employed in switches and silicon transistors of type П103 (P103) in the amplifier, together with diodes type Д2 (D2), to decrease the effect of temperature variations. The basic circuit diagram of a single quadrant multiplier-divider circuit is also given. The participation of laboratory technicians I. A. Katsnel'son and B. K. Petrov is acknowledged. This article was recommended by the Kafedra vychislitel'noy tekhniki (Department of Computer Techniques). There are 5 figures and 1 Soviet-bloc reference.

TITLE:

Methods of designing function converters with width modulation and averaging of voltages of special shape

PERIODICAL: Izvestiya vysshikh chebnykh zavedeniy. Priborostroyeniye,  
v. 5, no. 1, 1962, 49-46

TEXT: The authors consider a method of designing function converters (FC) which make it possible to obtain d.c. voltages or time intervals related to the input quantity by any functional relationship. The inputs may be d.c. voltages or in some cases, time intervals. The described FC circuits utilize either linear or functional width modulation of special shape voltages with subsequent averaging of the produced modulated pulse voltage. The FC circuits are based on configurations of pulse-time analogue circuits, in particular on a pulse voltage divider (VD). The VD is assumed to be linear, i.e. output voltage  $U_2 = U_1$  (input voltage) and  $U_2 = \frac{U_1}{T}$ .

Card 1/3

S/146/62/005/001/006/011

D201/D302

Methods of designing function ...

where  $\tau$  and T are the two positions of the switch.  $U_1(t)=f_1(t)$  used is a voltage of special shape - d.c., exponential, saw-tooth, sinusoidal etc. Since the output voltage is the d.c. voltage  $U_2$ , which with periodic changes of  $U(t)$  is fully described by the mark-to-space ratio of the pulse

1  
voltage; such an operation is called the operation of functional width demodulation. The functional width demodulator (FWD) may thus be used as a VD to reproduce the dependence  $U_{out}=F(\tau)$ . The analogue operation of different VD bloc-arrangement is tabulated for d.c., sinusoidal, linear and exponential special voltage waveforms. Allowing for all possible errors the accuracy of VD circuits with FWD is stated to be between 0.1 and 1% of the max. value of input quantity and their speed of operation depends mainly on the time constant  $\kappa C$  of the averaging network and corresponds roughly to a pass-band of 10-50 c/s. The presence in VD of a time dependent quantity makes it possible to use VD circuits in conjunction with typical units of digital computers in order to obtain a mixed, continuous

TITLE: Pulse-spectrum function generator

SOURCE: Avtomatika i telemekhanika, v. 24, no. 6, 1963, 830-838

TOPIC TAGS: function generator, pulse-spectrum function generator

ABSTRACT: A function generator is theoretically considered in which pulse-duration and pulse amplitude modulations are combined and the result is expanded into a Fourier series. The system is illustrated by an example of a sine-type function generator where d-c square pulses are first duration-modulated, then amplitude-modulated, and, finally, passed through a selective filter which isolates one of Fourier's harmonics. Possible static errors are analyzed, and some experimental verification of the system is reported. It is claimed that this type of function generator: (1) permits both multiplication and function conversion; (2) permits functional conversion of info supplied in the form of duration-modulated square pulses; (3) is suitable for use in digital-analog computers; (4) based on well-established standard electronic units. Orig. art. has: 7 figures and 22 formulas.

**ABSTRACT:** The authors describe a four-quadrant multiplier and divider based on the widely known principle of pulse-time multiplication. A block diagram of the device is shown and its operation is explained. The device has a maximum relative error of 0.1% in an ambient temperature range from 0 to +60°C. A schematic diagram is given for the electronic part of the device together with a detailed description of its operation. The circuit of the device is divided into two sections. The first section contains a sawtooth voltage generator, common collector amplifier, Schmitt trigger circuit, and two pulsed voltage dividers. The operation of the voltage dividers is illustrated by time diagrams. This first section is used for pdm and pam of the square-wave voltage. The second section of the multiplier-divider is a d-c amplifier. This unit has a voltage amplification factor of 20,000, input impedance of 5 kΩ, and a maximum zero drift at the output of 0.4 mv from +20 to +60°C. Data are given on error

PHASE I BOOK EXPLOITATION      POL/5981

Symposium on Electronacoustic Transducers. Krynica, 1958

Proceedings of the Symposium on Electronacoustic Transducers [held in] Krynica,  
17-26 September, 1958. Warsaw, Państwowe Wydawnictwo Naukowe, 1961. 442 p.  
Errata slip inserted. 630 copies printed.

Sponsoring Agency: Polish Academy of Sciences. Institute of Basic Technical  
Problems.

Ed. in Chief: Janusz Kacprowski, Doctor of Sciences; Editing Committee: Ignacy  
Malecki, Professor, Doctor of Sciences; Wincenty Pajowski, Doctor; and Jerzy  
Wohr, Master of Sciences; Secretary: Juliusz Mierzejewski.

PURPOSE: This book is intended for physicists and acoustical engineers.

COVERAGE: The book is a collection of detailed research papers constituting the  
proceedings of a conference held in Krynica from 17 to 26 September 1958 under  
the auspices of the Institute of Technical Problems, Polish Academy of Sciences.

## Symposium on Electroacoustic Transducers

POL/5981

The following basic problems are treated: 1) theoretical research on energy transformation processes; 2) experimental development of new types of transducers; 3) electroacoustic measurements; 4) technology of piezoelectric and magnetostrictive materials; 5) construction of transducers for technical needs; and 6) design of acoustical transducer systems. No personalities are mentioned. References (if any) follow the individual articles.

B006/B060

the heat treatment temperature and the curve obtained was compared with that taken from technically pure BaTiO<sub>3</sub>. While the  $\varepsilon$  of high-purity BaTiO<sub>3</sub> specimens attains a maximum (6000) at a temperature of 1240°C, and then drops to a constant value of 2300, the  $\varepsilon$ -value of technically pure specimens remains below 1500. Fig. 2 shows  $\varepsilon$  as a function of the duration of the heat treatment at 1270 and 1350°C (high purity) and 1350°C (technological). Only in the former case does  $\varepsilon$  decrease with time, while remaining constant in the two latter cases. Fig. 3 illustrates the dependence of density, porosity, and water uptake of the specimens on the heat treatment temperature. The sharpest changes were observed at 1240°C. At this temperature, density attains its maximum (5.94 g/cm<sup>3</sup>) and conserves it; porosity and water uptake are practically nil. Fig. 4 shows micro-pictures of sections of the individual specimens undergoing a heat treatment at various temperatures. The grain size was found to be highly temperature-dependent. There are 4 figures and 5 non-Soviet references. ✓

AUTHORS: Anan'yeva, A. A., Strizhkov, B. V., Ugryumova, M. A.

TITLE: Dielectric and Piezoelectric Properties of Chemically Pure Barium Titanate Ceramics

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,  
Vol. 24, No. 11, pp. 1405 - 1408

TEXT: This is the reproduction of a lecture delivered at the Third Conference on Ferroelectricity which took place in Moscow from January 25 to 30, 1960. N. S. Novosil'tsev, A. L. Khodakov, and the authors of this paper examined polycrystalline specimens of chemically pure barium titanate and determined the dependence of the electrophysical properties on the heat treatment temperature. A report is made here of the dielectric, elastic, and piezoelectric properties of chemically pure BaTiO<sub>3</sub>. The heat treatments were made at 1180, 1240, 1270, and 1400°C (specimens 1 - 4), and also commercially pure specimens (No. 5) were examined for a comparison (1380°C). Investigation results are given in diagrams and tables. Fig. 1 shows the temperature dependence of the various specimens 1 - 5, the peak

values being tabulated. Fig. 2 shows  $\epsilon(t)$  for polarized and nonpolarized coarse-grained chemically pure  $\text{BaTiO}_3$  specimens; the two  $\epsilon$ -peaks (1st and 2nd phase transition) are well marked and are somewhat higher for the polarized specimen. The acoustic velocity  $c$  was determined in pure  $\text{BaTiO}_3$  ceramics on the basis of the radial vibrations of polarized specimens. Fig. 3 shows its temperature dependence;  $c$  rises rapidly with temperature and remains practically constant from  $1300^\circ\text{C}$  on. Fig. 4 illustrates the dependence of the piezoelectric modulus  $d_{31}$  on the heat treatment temperature. For chemically pure  $\text{BaTiO}_3$  ceramics,  $d_{31}$  is about 1.5 times as high as for commercially pure  $\text{BaTiO}_3$ . Specimens submitted to heat treatment below  $1250^\circ\text{C}$  exhibited very high  $d_{31}$  values; thus, e.g., the specimen treated at  $1170^\circ\text{C}$  had a  $d_{31} \sim 5 \cdot 10^{-6}$  CGSE. There are 4 figures, 2 tables, and 4 references: 3 Soviet and 1 US.

AUTHOR: Anan'yeva, A. A.; Nisakova, N. I.; Korovinov, M. A.

TITLE: The effect of temperature on the electrical conductivity of  $Pb_{0.8}Ba_0.2Nb_2O_8$  unmodified and modified by the addition of  $La_2O_3$

SOURCE: Kristallografiya, v. 10, no. 3, 1965, 430-431

TOPIC TAGS: ferroelectric material, rare earth, piezoelectric ceramic, electrical conductivity

ABSTRACT: A low temperature break was observed in the curve for electrical conductivity as a function of temperature  $\log \sigma = f(1/T)$  corresponding to a change in the physical mechanism of conduction. This change is associated with the appearance of a basic atom in the lattice - the charge transfer level of oxygen atoms. The electrical conductivity. An addition of 0.5 molar % of  $La_2O_3$  shifts the temperature of the  $Pb_{0.8}Ba_0.2Nb_2O_8$  system at which the transition from one type of conduction to another

AUTHOR: Anan'yeva, A. A.; Ugryumova, M. A.

TITLE: Investigation of the influence of lanthanum-oxide and zirconium-dioxide additives on the dielectric and piezoelectric properties of lead barium metaniobate

SOURCE: Akusticheskiy zhurnal, v. 11, no. 1, 1965, 24-29

TOPIC TAGS: dielectric property, piezoelectric property, lead barium metaniobate, elasticity modulus, additive, zirconium dioxide, lanthanum oxide

ABSTRACT: This is a continuation of an earlier investigation by the authors. An increase in the concentration of lanthanum oxide up to 1.0 mol.% La<sub>2</sub>O<sub>3</sub> to a solid solution Pb<sub>0.8</sub>Ba<sub>0.2</sub>PbO<sub>3</sub> increases the dielectric constant and the piezoelectric modulus. In the present study the authors investigated the effect of varying the lanthanum oxide concentration by testing samples with 0.0, 0.10, 1, 2, and 3 mol.% above the main composition. In addition, they investigated the effect of varying the content of ZrO<sub>2</sub> (0.0, 0.75, 1, 2, and 3 mol%) in the same solid solution. The standard test procedure was employed. The results
