TITLE:

Inhomogeneous Magnetic Fields for the Focusing of a
Divergent Beam of Charged Particles

PERIODICAL: Vestnik Leningradskogo universiteta. Seriya fiziki i khimii,
1960, No. 2, pp. 28-33

TEXT: In a previous paper by V. R. Saulit (Ref. 1) the focusing properties of an inhomogeneous magnetic field, which in the mirror symmetry plane depended only upon a Cartesian coordinate, were investigated. The general condition for the ideal focusing of a plane beam of charged particles was obtained in form of a nonlinear integral equation, the solution of which was found. In the present paper, the class of magnetic fields of aberration and without a plane bundle of charged particles which permits calculation of charged particles emitted by a point source is shown, and calculation is carried out for a special case. The scheme of the focusing is given (Fig. 1). In Fig. 2, the results obtained by calculating the focusing magnetic field in the

AUTHOR: Unt, V.A.

TITLE: Centrally-symmetric gravitational fields and continuity conditions in the general theory of relativity

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika, no. 4, 1961, 3-8

TEXT: The present author reports an analysis of the Lichnerowicz (Ref. 1: Théories relativistes de la gravitation et de l'électromagnétisme, Paris, 1955) conditions in the case of centrally symmetric gravitational fields when the field source is in the form of a sphere of a perfect liquid having a constant density. It is shown that the Schwarzschild solution (Ref. 2: Sitzungsber. d. Preuss. Akad. d. Wissenschaft, 189, and 424, 1916) is not consistent with the Lichnerowicz conditions. It is shown that it is a consequence of the Lichnerowicz conditions that all the non-zero components of the metric tensor are functions of the radius of the central body. The specific form of this functional dependence is determined by the

coordinate conditions. The present author obtains a general expression for the integration constant (in harmonic coordinates) which was assumed equal to zero by V. A. Fok (Ref. 3: The theory of space, time and gravitation, Moscow, 1955) and Belinfante (Ref. 4: Phys. Rev., 98, 793, 1955). This constant was previously obtained (in approximate form) by Meister and Papapetrou (Ref. 5: Z. Phys., 145, 403, 1956). In the case of a perfect liquid having a constant density the Papapetrou-Meister constant is identical with the zero-order approximation to this constant obtained by the present author. Acknowledgments are expressed to Professor Kh.P.Keres for his interest in this work. There are 5 references: 1 Soviet-bloc and 4 non-Soviet-bloc.

TITLE: The Schwarzschild singularity

PERIODICAL: Referativnyy zhurnal, Fizika, no. 7, 1962, 24, abstract 7A232
("Tr. In-ta fiz. i astron. AN EstSSR", 1961, no. 16, 27 - 48;
English summary)

TEXT: The gravitational field properties of a material point M are investigated by considering the motion of freely falling experimental particles P with respect to local Galilean coordinate systems. It is shown that all experimental particles P must pass through the singular Schwarzschild surface $R = 2\alpha$ with the velocity of light and move inside this surface faster than light. In taking this fact into account, extending space into the region $R < 2\alpha$, however, possible analytically, seems doubtful. Therefore, the author identifies the singular Schwarzschild surface with the material "point". It is also shown that Finkel'shteyn's (RZhFiz, 1959, no. 3, 4850) "particle" and "antiparticle" are not different particles.

TITLE: Observations concerning the G-penicillin recovered from residual waters

SOURCE: Revista de chimie, v. 16, no. 3, 1965, 166-167

TOPIC TAGS: penicillin, chemical precipitation, recrystallization, paper chromatography, spectrophotometric analysis

ABSTRACT: The authors note that the penicillin G recovered by means of N,N-dibenzylethylenediamine salt from the mother liquor after precipitation of the mother product must be recrystallized in order to obtain a time-stable product free of foreign penicillins and decomposition products. To analyze the purity of the samples, they suggest spectrophotometric measurements of the absorption at 322 millimicrons as well as at 263 and 280 millimicrons in order to detect degradation products, and paper chromatography to detect foreign penicillins. "An Improved Technique for Obtaining Sodium Benzylpenicillin."
Bucharest, Revista de Chimie, Vol 17, No 4, Apr 66, pp 230-231.

Abstract [Authors' English summary modified]: A description of an improved technique for the preparation of sodium benzylpenicillin. The method is based on the precipitation of penicillin from the primary organic extract resulting from the processing of the native solution with cyclohexamine; after the division of the raw basic salt in acid medium in an organic solvent, the desired product is precipitated with the aid of a methanolic sodium acetate solution. The method is simple and involves lower raw material consumption, combined with higher yields as compared to older techniques.

Includes one table, one flow chart and four references, of which one Rumanian, one Russian and 2 German.

AUTHOR: Unterschutz, Z. (Engineer); Naruszewicz, E. (Engineer); Kaus, T.

TITLE: Method for cleaning slag and other impurities from metal surfaces and equipment for use with this method

SOURCE: Hutnicke listy, no. 4, 1984, 296

TOPIC TAGS: cleaning, weldability, electric arc, welding transformer, electric arc electrode, metal oxide

ABSTRACT: The invention permits the heat cleaning of a metal surface by an electric arc while at the same time removing slag and other impurities by a cleaning device forming one electrode of the electric arc, the other electrode being the metal surface to be cleaned. The invention is shown in diagram 1. Two plates 4 are set up on shaft 8. The drum formed in this way carries on the longitudinal rods 3 hooked up in its circuit the loosely attached plates 2 which are the working elements cleaning the metal surface 1. The required current is fed from welding transformer 5 via 9 to brush 6 and ring 7 which

Card 1/3

ACCESSION NR: AP4031750

is securely fixed to shaft 8. The other pole of the power supply is connected by conductor 10 directly to the metal part whose surface is to be cleaned. The alternating action of the electric arc makes possible rapid heat transfer which permits rapid separation and evaporation of the impurities and slag from the metal surfaces. Because the different substances have different rates of thermal expansion, they separate completely. Under the effect of high temperatures, metal oxides and other protective coatings are formed on the metal surfaces. This condition makes impossible the successive rewelding of the liberated impurities. [Complete translation]

Abstract: Treatment of seeds with boric acid in a concen-
tration of 0.2% accelerates the appearance of pan-
icles by 3-4 days, ripening of ears and increases
the grain harvest (by 7-23%). If the plant are
sprayed with boric acid the influence of the boron
is weaker. Nitric acid uranium lengthens the rip-
ening period of the ears and increases the harvest.

Abstract : Results of the investigations conducted at the Yassk Agrochemical Laboratory to determine the content of mobile forms of P in soils and their dependence on the mechanical composition of the soils, their water regimen, the reaction of the soil solutions, the periods of introduction of phosphate fertilizers into the soil, and the quantities of the fertilizers used are presented.

ABSTRACT: Lately, the uppermost layer clouds have been in the center of increased interest (see, e.g., A. M. Baranov, Meteorologiya i gidrologiya, no. 2, 1958; D. G. James, Met. Off. Prof. Notes, no. 123, 1957; R. J. Murgatroyd, P. Goldsmith, Prof. Notes. Met. Off., London 7, no. 119, 1956). The present paper is based on data collected by aircraft probes during 1958 and 1959 and by 16 temperature wind probing stations on the European territory of the Soviet Union. It investigates relationships between the vertical wind gradient in the upper troposphere and the clouds within the uppermost layer. Cases are utilized for which the vertical size

Card 1/2

L 62476-65

ACCESSION NR: AT5019691

of the clouds is 2 km or more and their lower boundary above 5 km. Results show that the uppermost layer clouds are generated more often and have larger vertical dimensions in zones of large vertical wind gradients than in zones with low vertical wind gradient values. (for reference see figure 1). In a separate paper detailed discussions of various aspects of cloud generation, development and evolution.

TITLE: Some distributional features of temperature and the zonal components of wind in the stratosphere over the northern and central parts of the Pacific Ocean

SOURCE: *Moscow. Tsentral'nyy institut prognozov. Trudy, no. 143, 1965. Stroyeniye troposfery i stratosfery i vzaimosvyaz' tsirkulyatsii Severnogo i Yuzhnogo Polushariy (Structure of the troposphere and stratosphere and interrelation of the circulations of the Northern and Southern Hemispheres), 3-23

TOPIC TAGS: atmospheric circulation, wind, stratosphere, atmospheric temperature

ABSTRACT: The temperature distribution and zonal components of the wind in the stratosphere over the equatorial, western, and northern parts of the Pacific Ocean and also over Alaska were studied. A well-defined biennial cyclicity (averaging 25--26 months) was established for the 17--30 km layer of the equatorial stratosphere. The eastern component generally increases with height; the western component decreases. The actual velocity of each component increases with height. The wind components become more complex northward ($7\text{--}14^\circ$ N lat), but the eastern component is much stronger than the western. The maximum eastern component occurs in summer, with the value in winter markedly less. In this zone the annual cycle

Card 1/2

L 32654-66

ACC NR: AT6017316

becomes appreciable. In the zone from 24 to 30° N lat, the lower stratosphere exhibits an annual cycle of wind variation. In the 20-36 km layer the eastern trend is dominant. Western currents are observed at these heights only when the biennial western trend of the lower latitudes appears. The biennial trend may be detected only to 30° N lat; in the temperate zone to the north it is missing. From 35 to 45° N lat, the western direction is dominant (at 100 and 80 mb), with a pronounced annual cycle, maximum velocity in winter, and minimum in summer. The western trend is dominant in the temperate zone (about 55° N lat) at the 80-mb surface. Above the 50-mb surface, an eastern current appears. At higher latitudes (60-70°), beginning at the 100- and 80-mb surfaces, an alternation of eastern and western components of wind is noted. Velocity of the western component gradually increases with height. This is due to the position of the westerly stratospheric jet stream, which lies on the northern edge of the zone and is felt most strongly there. The change from westerly to easterly circulation in the high latitudes begins before the change in lower latitudes. The annual behavior of temperature in the lower equatorial stratosphere and in high latitudes is approximately the same as in the troposphere. In the middle latitudes, the temperature in the lower stratosphere is somewhat less in summer than in winter. At 26-28 km and higher in the middle and high latitudes, two maximums (summer and winter) and two minimums (spring and fall) are noted in the temperature. In the lower stratosphere (100 and 50 mb), the horizontal temperature gradient is from north to south in the low and middle latitudes, but is reversed in higher latitudes. Orig. art. has: 7 figures and 3 tables.

Chemical Equilibria and Kinetics

U S S R .

Reciprocal system of hydroxides and chlorides of potassium and lithium. G. M. Dzhelarov (C. R. Acad. Sci. U.R.S.S., 1952, 87, 191-200). Thermal analysis of four binary systems, two diagonal and 19 internal sections allows the construction of a contour diagram of the system $KLiOH/KCl$. The area of the quadrilateral is divided into 9 fields, the largest of which is that of KCl . The equilibrium $KOH + LiCl \rightleftharpoons LiOH + KCl$ is shifted strongly towards $LiOH + KCl$ which has the greatest heat effect (20.54 kg-cal), the greatest sum of lattice energies (19.9 kg-cal), and the greatest difference of the sums of ionic radii. There are 6 invariant points, 3 of them eutectic. The introduction of hydroxides into the binary system $KCl-KCl$ favours the formation of complexes.
