Determination the unsaturation and lime requirement of soils. I. vol Geiky and I van Tobok (Proc 2nd. Internat. Congr. Soil Sci., 1932, 4, 175-180). Variations in the technique adapted in determining the hydrolytic acidity of solids by treatment with  $\text{Ca}(\text{OAc})_2$  lead to marked differences in the vals. obtained which are not comparable in soils of different type. Soils are classified as unconditionally CaO deficient and conditionally CaO deficient and characteristic limiting vals. of ph and hydrolytic acidity (Kappen) associated with the classification are recorded for various solid types.

TITLE: Kinetics of the combined carbothermic reduction of niobium and tungsten

SOURCE: Tsvetnyye metally, no 4, 1966, pp 67-70

TOPIC TAGS: vacuum furnace, chemical reduction, niobium, tungsten, niobium compound, /VVPS-10A type vacuum furnace

ABSTRACT: This is a continuation of a previous investigation (O. P. Kolchin et al. Tsvetnyye metally, 1964, no 7) with the difference that it deals with a detailed investigation of the kinetics of the combined carbothermic reduction of Nb and W from the mixtures of the oxides and carbides of Nb and alloy elements at various temperatures, the degree of reduction being determined according to the change in the C content of specimens following their heating in a VVPS-10A type vacuum furnace. In the reduction products the W content was determined by the photocalorimetric thiocyanate method, correct to 3-5% (rel.); the Nb content, according to weight gain when heating the specimen in air; and the C content, by the volumetric method. It was found that in the presence of W the degree of the reduction of  $Nb_2O_5 + 5NbC$  at 1200 and

Title : Effect of Oxidative and Reducing Fusion on  
Properties of Cast Stoneware.

Orig Pub: Sklar a keramik, 1956, 6, No 11, 264-270

Abstract: Study of properties of experimental cast articles  
made from eight varieties of acidic and basic  
rocks of Czechoslovakia (melaphyre, amphibolite  
basanite, nephelinite, diabase, etc.), produced  
under conditions of oxidative (OF) and reducing  
fusion (RF), in a laboratory furnace heated with

city gas. The fusions were conducted at 1350-1400° for 2-2.5 hours. To provide the conditions of OF 10%  $\text{NH}_4\text{NO}_3$  were added to the batch, 1-2% graphite, or 2-5% coke, were added for a RF, while neutral fusion (NF) were conducted without any addition to the batch. The cast specimens were cooled slowly in an electric furnace heated at 600°. Chemical analysis showed that the  $\text{FeO}:\text{Fe}_2\text{O}_3$  ratio is 2.15-7.40 in RF specimens, 0.5-1.0 in OF, and about 1.0 in NF specimens. Differential thermal analysis revealed a most clearly manifested reaction of  $\text{Fe}_3\text{O}_4$ -formation and crystallization of pyroxenes in RF specimens.

On annealing of the specimens at 830-840° for 24 hours, greatest deformation and compression of the surface layer was observed in RF specimens, which indicates their tendency to undergo secondary crystallization. The RF specimens show also a higher coefficient of thermal expansion, considerably greater resistance to abrasion, higher electric conductivity, hardness and chemical stability to the action of HCl, their compression is 35-65% higher than that of OF specimens. The high crystallization capacity of RF specimens was noted (about  $Fe_3O_4$  nuclei a rapid crystallization of pyroxenes takes place) to which the author attributes, essentially, the improved

Chemical resistance of different rocks to pollutants. (J. V. Young and E. J. Lester, Int. J. Min. Proc., 1980, 10, 103-130). Corrosion methods were discussed and compared with DIN 1211, DIN 1211 (b) and DIN 1211 (c). More than 100 samples of natural (I), weathered (II) and rock (III) dolomites (CaCO<sub>3</sub>) were tested. Reactions between CaO acids (CaO, HCl, LiOH and Na<sub>2</sub>CO<sub>3</sub>) and these were measured toward H<sub>2</sub>O and bases (NaOH, K<sub>2</sub>CO<sub>3</sub>, NH<sub>4</sub>OH and LiOH) of I, II or III of the material. The reaction was highest for II, lower for I and lowest for III. Samples of the rock had a pronounced influence on the resistances which was reduced especially at where the sum of corrosion increased with increasing pH (see references).

Title : A Few Examples of the Utilization of Radioisotopes in the Glass Industry and in Related Fields

Orig Pub: Sklar a keramik, 1957, 7, No 6, 170-175

Abstract: In a series of examples, the possibility is shown of using radioactive isotopes (RI) for the solution of some technological problems. Thus, for example, the use of RI of sodium, calcium, barium, and phosphorus permits an investigation of the flow of the glass mass in fire baths, the degree of homogenization, the period of melting, et cetera.

AUTHOR:	Voldan, Jan (Doctor of natural sciences, candidate of sciences)		B
TITLE:	Controlled crystallization of fused cast materials		
SOURCE:	Sklar a keramik, no. 8, 1964, 220-223		
TOPIC TAGS:	controlled crystallization, fusion casting, glass manufacture, glass additive, fluorine additive, nucleation		
ABSTRACT:	Products from molten rock, which served as scarcce metals, are now important refractory and Only their unsatisfactory and irregular mechanical frequent use. In the present paper, the theory of facture on a laboratory and commercial scale and Most of the work done up to now has been within the and crystallization additives for basalt melts, TiO <sub>2</sub> , MnO <sub>2</sub> and chromite are generally used. The different phases occurring in it is pointed out that these products are of better than products from basalt only. However, surface ed and the mechanical properties, while improved, vitreous melts. The author presumes that the high Card 1/3	originally as a replacement for imically resistant materials. properties prevent their more fusion castings, their manu- their properties are discussed. Soviet block. As nucleation O <sub>2</sub> , MnO <sub>2</sub> and chromite are these melts are described, and a quality and more homogeneous crystallization cannot be avoided. still do not equal those of Fe content (12-14%) of basalts	

L 23088-65  
ACCESSION NR: AP4044480

is not beneficial. Therefore, attention is drawn to materials with a lower Fe content and to more acidic rocks, like phonolite and granite. Since these have a very high melting point and an undesirably viscous consistency, cheap materials like calcite and dolomite are added to lower the viscosity and to improve the nucleation and crystallization properties. As nucleation additives, fluorine compounds ( $\text{CaF}_2$ ,  $\text{Na}_3\text{AlF}_6$  or  $\text{Na}_2\text{SiF}_6$ ) are used. Many patents mention fluorine as a nucleation agent. During the production of these melts, ground ingredients have to be used, and basalt can be used as a base material. Precautions have to be taken to minimize the amount of volatiles, especially water. The potential loss of materials is about 10% due to volatiles. Melting temperature is 1,300°C for basalt. These materials melt at 1,100°C and crystallize at 1,000°C. The melt is quenched at 1,300°C or above, in metal molds. Crystallization starts at 700-800°C. Castings are placed in ovens when they are below 900°C, to induce good nucleation, and are then heated slowly to 850-900°C to achieve fine-grain crystallization. If heated above 900°C, deformation could occur. As the main ingredients, 50-75% phonolite and granite are used. The mechanical and physical properties of these materials are presented. These materials cannot yet replace basalt-based products, but should find some economical uses. Further studies will be undertaken in this direction. Orig. art. has: 8 figures.

TITLE: Spectroscopic study of the interaction between anthracene derivatives and monomers during polymerization. II.  
Interaction of anthracene with styrene

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 5, no. 1, 1963, 79-86

TEXT: Anthracene was dissolved in styrene and was polymerized, both with and without benzoyl peroxide, in order to explain the behavior of luminescing plastics. The time of heating was varied between 1 and

150 hrs, the temperature was kept between 80 and 154° C, and the concentration of anthracene was changed between 0.5 and 15.2%. Low-molecular products were removed from the polymer by reprecipitation, and its absorption and fluorescence spectra were recorded. The existence of a

weak absorption band in the region of long waves ( $26900 \text{ cm}^{-1}$ ) indicated hydrogen substitution in the meso-position of anthracene by styrene or polystyrene. Its fluorescence spectrum also corresponded to that of

Card 1/3

Spectroscopic study of the ...

monosubstituted anthracene. The conversion of 5% anthracene into styrene anthracene or polystyrene anthracene was estimated from the intensity of absorption band. The polymer contained 20 - 28% of the anthracene addition, whatever the polymerization conditions. Polymerization of

anthracene dissolved in styrene at 144°C showed that during the first 4 hrs the ratio polymerization degree : degree of anthracene conversion remained constant at 0.5 independently of the initial anthracene concentration (0.5 - 2.4%). The synthesis of the anthracene-styrene adduct was reached after 150 hrs at 120°C, and after 4 hrs at 200 - 210°C. A crystalline substance, m. p. 95 - 96.5°C, was obtained, whose molecular weight corresponded to an adduct consisting of 1 molecule anthracene and 1 molecule styrene. Its absorption spectrum confirmed the addition of styrene in the 9, 10 positions of anthracene, which again proves a diene synthesis. Heating to 260°C caused decomposition. The absorption and fluorescence spectra of the substance crystallized by cooling (m. p. 193 - 200°C) corresponded to those of anthracene. There are 4 figures and 1 table.

TITLE: Photoluminescent Characteristics and Relative Intensities of Scintillations of Plastic Scintillators Containing Anthracene Derivatives.

(O fotolyuminestsentnykh kharakteristikakh i  
otnositel'nykh intensivnostyakh stsintillyatsiy  
plasticheskikh stsintillyatorov s proizvodnymi  
antratsena.)

PERIODICAL: Optika i Spektroskopiya, 1958, Vol.IV, Nr.3,  
pp. 344-347 (USSR)

ABSTRACT: Anthracene was one of the first substances used to make plastic scintillators (Ref.1). The authors studied scintillators which contained various derivatives of anthracene. These scintillators were prepared by polymerization of styrene in which the studied substance (2% by weight) was dissolved. The relative magnitudes of scintillation pulses under the action of  $\gamma$ -rays and the fluorescence spectra, quantum yields of fluorescence and durations of the excited state of the scintillators were studied. Samples were prepared and their scintillation efficiency was measured at the Institute of High-Molecular Compounds of the Academy of Sciences

Card 1/4

Derivatives.

of the USSR in M.M. Koton's laboratory. Fluorescence was excited by mercury lines of about  $365 \text{ m}\mu$  wavelength. Quantum yields were found from the ratios of areas bounded by fluorescence spectra. Durations of the excited state were measured by means of a fluorometer as described in Ref.3. The relative magnitudes of scintillation pulses obtained using various derivatives of anthracene are given in the table on p.345. For derivatives with alkyl, aryl, methoxy-, acetoxy- and acetylamino-groups in meso-positions of the anthracene nucleus or alkyl substituents in  $\alpha$ - and  $\beta$ -positions of anthracene an increase of the pulse heights is observed compared with plastic scintillators containing anthracene itself. The most effective are diaryl derivatives of anthracene, particularly 9,10-diphenyl and 9,10-di-(n-anisyl)-anthracene (their efficiency is of the same order as that of scintillators with terphenyl). Introduction of methyl groups into phenyl rings or into  $m$ - and  $n$ -positions of diphenylanthracene lowers the

Derivatives.

relative pulse height, compared with the most effective compounds. From the relative quantum yields and the known value of the absolute quantum yield of fluorescence of anthracene dissolved in benzene, the absolute quantum yields of fluorescence of scintillators with anthracene derivatives were calculated. In almost all compounds studied here the absolute quantum yields are high, and in the case of diaryl derivatives they are close to unity (see table on p.345). The authors conclude that of the studied anthracene derivatives the best scintillators can be obtained using mesoaryl derivatives of anthracene, whose scintillations are 2.5-3 times more intense than anthracene scintillations. The same scintillators have also the shortest duration of the excited state (of the order of  $10^{-8}$  sec). The high relative intensity of scintillations of mesoaryl derivatives of anthracene is due to their high quantum yields of fluorescence, nearness of the fluorescence

Title : Fluorescence duration of anthracene mesoderivatives.

Orig Pub : Dokl. A.N. USSR, 1956, 109, No 2, 292-294.

Abstract : Average durations of fluorescences ( $\tau_e$ ) of anthracene solutions ( $\Lambda$ ) and 46 of its mesoderivatives (alkyl-, aryl-, galogeno-amino-, acetyl-nitro-, methoxy- and a series of others replaced by  $(A)$ ) are measured on a phase-fluorometer in  $C_2H_5OH$  at indoor temperature. Values of  $\tau_e$  for the indicated  $A$ - derivatives lie in the range of  $1.0-12.0 \cdot 10^{-9}$  sec. Values of  $\tau_e$  divided by the amount of the absolute quantum yield of substances of fluorescence ( $\eta$ ) measured in the same conditions, are compared with the maximum span of life of the 1st excited state of  $\tau_a$ , obtained from the area of the long wave band of absorption of the  $A$  derivative solutions. It is shown, that the values  $\tau_e/\eta$  and  $\tau_a$  coincide better if the computation of  $\tau_a$  will be effectuated on the basis of the formula proposed by

AUTHOR: Cherkasov, A. S.; Voldaykina, K. G.

TITLE: Absorption and fluorescence of vinyl anthracenes and change of the molecular configuration due to excitation [Report: Eleventh Conference on Luminescence held at Minsk 10-15 Sept. 1962]

SOURCE: Izvestiya AN SSSR. Seriya fizicheskaya, v. 27, no. 5, 1963, 628-633

TOPIC TAGS: methyl anthracenes, vinyl anthracenes, anthracene, fluorescence, molecular absorption

ABSTRACT: As a result of investigation (Cherkasov, A. S., Doklady AN SSSR, 125, 848, 1951) of anthracene derivatives with an alkyl group in the meso position in the anthracene nucleus it was found that such substituents have a minor effect on the absorption and fluorescence spectra of anthracene, namely, produce a shift of both spectra to the side of lower frequencies. It was deemed of interest to see how the spectra would be affected by changes in the position of the substitute; accordingly, there were synthesized and investigated 9-vinyl, 1-vinyl and 2-vinyl

Card 1/2

L 10160-63  
ACCESSION NR: AP3000314

anthracenes, steric hindrance in which differs. The spectra of the vinyl derivatives are compared with the spectra of the corresponding methyl derivatives. The effect of the substituents is attributed to enhanced interaction of the pi electrons of the substituent group with the pi electrons of the anthracene nucleus. It is shown that in the case of 2-vinyl anthracene in alcohol solutions there occurs cis-trans isomer conversion under the influence not only of temperature but also excitation. This is substantiated by the shift of the fluorescence spectrum as a result of addition of a quenching agent to the alcohol solution. Orig. art. has: 4 figures and 1 table.

Machines

2  
①  
1890. Influence of the non-uniformity of the airgap  
on the differential leakage of an ~~synchronous~~ machine.  
A. I. Vol'pek. Elektrichesvo, 1953, No. 8, 32-8. In  
Russian.

In normal operating conditions of an induction machine, practically all the higher harmonics of stator and rotor fields set up leakage fluxes which have to be considered in the calculation of the so-called differential leakage inductances. Only in machines with short-circuited rotor does some damping of the higher harmonics of the stator field take place. Owing to the comparatively small width of the air gap the differential leakage inductances are relatively large and represent 25-40% of the total leakage inductance of the machine. This requires a fairly accurate calculation of the leakage inductances. This problem has so far been solved only by assuming a uniform air gap (infinitely small slot openings). The author proves that the differential leakage reactance for non-uniform air gaps may be determined by introducing a correction in the expression of the differential leakage coefficient derived for a uniform air gap. Formulae and curves for determining this correction factor are presented.

TITLE: The Magnetic Field of the Inductors in Linear Electro-  
magnetic Pumps

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Elektromekhanika, 1958, Nr 12, pp 14-20 (USSR)

ABSTRACT: A considerable amount of work has been done at the Tallin  
Polytechnical Institute on the investigation of electro-  
magnetic induction pumps. Some of the results of this  
work are published in the paper; these deal primarily  
with the theory of the induction pumps. A flat linear  
induction pump is first considered (shown diagrammatically  
in Fig 1). The inductor cores 1 are constructed from  
electrical-steel sheets. The three-phase winding 2 is  
situated in the slots at both the cores. The gap 3 having  
a rectangular cross-section is made of a suitable metal or  
alloy. The magnetic field in the gap of the pump is  
evaluated under the following assumptions: (1) the  
dimensions of the inductor in the plane xoy are infinite;  
(2) the surfaces of the inductor contain no slots;  
(3) the permeability of the cores is infinite; and ✓

Card 1/4

SOV/144-58-12-2/19

## The Magnetic Field of the Inductors in Linear Electromagnetic Pumps

(4) the permeability in the gap is  $\mu_0$ . The magnetic field can be evaluated from the scalar magnetic potential  $\varphi$  which satisfies Eq (1). If it is assumed that  $\varphi$  is in the form of the second equation on p 16, where  $F_m$  is the amplitude of  $\varphi$ , and  $\tau$  is the pole ratio, the amplitude  $F_m$  is given by the fifth equation on p 16. The final expression for the amplitude is in the form:

$$F_m = - \frac{B_0}{\mu_0 a} \cdot \frac{\text{sh}az}{\text{ch} \frac{a\delta}{2}} \quad (2)$$

where  $B$  is the field at  $z = \delta/2$  (see Fig 1). The field in the centre of the gap is given by Eq (3). The so-called reduction coefficient  $k_n$ , which determines the ratio of the field at the boundary to the field in the centre, is given by Eq (5). The magnetising force  $F$  in both the inductor windings (per one pole) is expressed by Eq (6), where  $k''_{\delta}$  is expressed by Eq (7). The coefficients  $k_n$  and  $k''_{\delta}$  are plotted in Fig 3 as a function of  $\delta/\tau$ . A cylindrical linear electromagnetic pump is shown in Fig 2. Here, 1 and 4 represent the external and the internal ferromagnetic cores of the

Card 2/4

SOV/144-58-12-2/19

The Magnetic Field of the Inductors in Linear Electromagnetic Pumps  
inductor, 2 is a three-phase winding situated in the slots along the axis of the pump, and 3 is the gap of the pump having an annular cross-section. The air gap of the pump can be represented as shown in Fig 5. The magnetic potential of the system can be evaluated from Eq (12). The amplitude of the potential can be found from the first equation on p 19. The solution of this is represented by:

$$F_m = - \frac{B_0}{\mu_0 a} \cdot \frac{K_0(ar_2) \cdot I_0(ar) - I_0(ar_2) \cdot K_0(ar)}{K_0(ar_2) \cdot I_1(ar_1) + I_0(ar_2) \cdot K_1(ar_1)} \quad (13)$$

where  $I_1$  and  $K_1$  are modified Bessel functions of the first and second kind of the first order, respectively. The reduction coefficient is now given by Eq (15) and the air gap coefficient  $k''_\delta$  is expressed by Eq (16). The values of the reduction coefficient  $k_n$  for the pump are shown in Fig 6, while the coefficient  $k''_\delta$  is plotted in Fig 7.

Kontsevitsya po magnetnoy elektrodinamike. Riga, 1958.

Voprosy magnetnoy elektrodinamiki i atomnogo plazmy, trudy Konferentsii. Voprosy magnetnoy elektrodinamiki i atomnogo plazmy. Trudy Konferentsii. Trudovye Doklady po Neorganicheskym i Plazmam. Dinamicheskym Protsessam v Radiofizike i Radiochimii. Nauka, Latvija. Riga, 1959. 315 p. Stranitsa sally izlozhen. 1,000 copij printed.

Organizing Agency: Akademija nauk Latvijes SSR. Izdatelstvo fizika.

MATERIALS: Prof. Dr. Frank-Kamenetskij, Doctor of Physics and Mathematics, Professor; A.I. Vol'skij, Doctor of Technical Sciences, Professor; I.M. Kirov, Doctor of Physics and Mathematics; V.I. Vilkov, Candidate of Physics and Mathematics; V.D. Vitov, Candidate of Physics and Mathematics; Nadejda Aronova; and V.Zh. Krashevskij.

MATERIALS: L. Sopkal'baum, Tech. Ed.; A. El'gortova.

PURPOSE: This book is intended for physicists working in the field of magnetohydrodynamics and plasma dynamics.

CONTENTS: This volume contains the transactions of a conference held in Riga, June 1958, on problems in applied and theoretical magnetohydrodynamics. The objects of the conference were the investigation of the basic trends in theoretical and applied magnetohydrodynamics, establishing contact between theoretical and applied magnetohydrodynamics, and plasma hydrodynamics and investigating the participation of theoretical physicists in problems in applied magnetohydrodynamics. More than 150 persons from different parts of the Soviet Union took part in the conference, and 55 papers were read. Similar conferences are planned for the future; each conference is scheduled to last one week. In the future, the next such conference is scheduled to be held regularly in the future. The work of each conference is presented in the form of a present collection of the transactions of the conference. The contents of the papers and comments on papers are presented by the authors themselves in an abridged form. The book is divided into two parts. The first part deals with problems in theoretical magnetohydrodynamics and plasma dynamics, and consists of 35 articles on such aspects of the problems as the application of magnetohydrodynamics in astrophysics (D.A. Frank-Kamenetskij), magnetohydrodynamics and the investigation of atomic-ray variations (I.V. Borodavko), magnetohydrodynamics and the investigation of acoustic-wave variations (G.V. Gordeev and I.I. Oshchepkov). The second part, consisting of 35 articles, details with problems of experimental magnetohydrodynamics, including the application of physical simulation for investigation of electromagnetic processes in liquid metals (I.M. Kirov) and the development of a magnetohydrodynamic pump (P.O. Kirillov). At the Institute of Physics of the Academy of Sciences, Latvija SSR, several articles are devoted to induction pumping, electromagnetic crucibles, electromagnetic stirrers for molten metals, and their application in the metallurgical industry including schematic diagrams of their power-supply systems. References are given at the end of most of the articles.

MATERIALS: I.I. Modelling the Electric Field of Electromagnetic Pump in an Electrolytic Bath and with Electrodynamic Paper
