***5083. Radioactive colloidal gold and its influence on the mitotic activity of tumour cells (Russian text)** VOLODARSKAYA S. M. I. Med. Inst., Moscow *Vopr. Onkol.* 1959, 5/9 (365-366)

White mice with the Ehrlich ascites tumour were injected with 0.025 μc. of radioactive colloidal gold into the peritoneal cavity. Three hr. after the injection a decrease of the mitotic activity of the tumour cells could be noted. The karyoclastic effect was most marked after 24 hr. After 120 hr. the mitotic activity was still not fully restored. (XVI, 14)

TITLE: Process for Obtaining a Fluxed Sinter from the Ores of Bakal (Tekhnologiya polucheniya oflyusovannogo aglomerata iz rud Bakal'skogo mestorozhdeniya)

PERIODICAL: Byul. nauchno-tekhn. inform. Ural'skiy n.-i. in-t chernykh metallov, 1957, Nr 3, pp 26-36

ABSTRACT: With the object of determining the optimum conditions for producing a fluxed sinter (S), a detailed study is made of the effect of the moisture content of the charge (CH), the fuel consumption, the amount of limestone (basicity) and return fines, and also the additions of blast furnace flue dust. The investigations showed than an increase in the moisture content of the CH over 9.9% diminishes the output of the sintering equipment and impairs the mechanical properties of the S despite a certain increase in permeability to gas. Therefore, the optimum moisture content of the CH should be determined not only on the basis of the maximum permeability of the CH to gas in the course of the sintering, but also with consideration of the yield of product

Card 1/2

Process for Obtaining a Fluxed Sinter from the Ores of Bakal'

per m^3 CH and the quality of the S. The C contents of the CH should not exceed 5% and should be held constant. The amount of return fines in the CH when lightweight ores of high silica content are sintered should be held in the 35-40% range. Moreover, the return fines should be well roasted and of adequate fineness ($\leq$10-12 mm). An increase in the basicity of the S to 1.3 is accompanied by a noticeable improvement in the barrel-mill test index and in reducibility, with simultaneous reduction in the C contents of the CH from 5.1 to 4.68%. The free lime contents of such an S is $\leq$0.6%. Introduction of up to 60% siderite (0-6 mm) into the CH to obtain an S with a (CaO+MgO) /(SiO_2+Al_2O_3) basicity of 1.3 makes for about a one-half saving in limestone consumption and thus for production of a less fused S with higher strength and lumpiness. The amount of blast-furnace flue dust should not be raised to over 20-25%. Consideration of the results of the investigations at this Kombinat lead to proposals for a number of measures to improve blast-furnace performance parameters.

The All-Union Conference of Statisticians [illegible] soveshchaniye statistikov)

PERIODICAL: Vestnik Statistiki, 1957, # 4, pp 12 - 49 (USSR)

ABSTRACT: By order of the Government, the USSR TsSU (Central Statistical Administration attached to the Council of Ministers) held an All-Union Conference of Statisticians in Moscow from 4-8 June 1957, in which more than 650 persons participated. V.N. Starovskiy, Chief of the USSR TsSU, reported on the first subject on the agenda: "Practical and scientific problems of statistics arising from the decisions of the TsK KPSS February Plenum concerning the further improvement in organizing the administration of industry and construction trade". The main problem before the Soviet state statistics is presently, to ensure a centralized system of recording, primarily in industry and the construction trade. The article deals further with the present inflated system of statistics, stating that with the reorganization of the administrations of industry and the construction trade, it will now become possible to deliver and process all statistical records within the organs of state statistics. The

[illegible], Chief of the Statistical Administration, [illegible] Oblast'; V.P. Perepelkin, Chief of the planning section of a machine construction plant; V.I. Pereslegin, Chief of Book-keeping and Accounting Administration of the USSR Finance Ministry; N.V. Tsogoyev, Chief of the Stavropol' Kray Statistical Administration, and T.U. Uvashev, Chief of the Kazakh [illegible] Statistical Administration; participated in further discussions. T.V. Ryabushkin, Chief of the Statistical Section, Institute of Economics of the USSR Academy of Sciences, welcomes the actions directed toward the development of a system of centralized state statistics. Academician S.G. Strumilin, considering Soviet statistics as the best in the world, indicates a number of deficiencies especially in the field of agricultural statistics. V.E. Ovsiyenko, Director of the Moscow Institute of Economics and Statistics , dealt with the question of training cadres for mechanization of accounting and statistical work.

The article mentions a number of other scientists who participated in the debate and summarizes the reporter's concluding speech. The resolution adopted by the Conference thereafter aims at a substantial improvement in the management of the

TITLE: The Historical Victories of Socialist Economy (Istoricheskiye pobedy sotsialisticheskoy ekonomiki)

PERIODICAL: Vestnik Statistiki, 1957, # 5, p 21-39 (USSR)

ABSTRACT: The authors give a survey on the Soviet economical development from 1917 until now.

Referring to the social structure of the USSR, the authors present statistical data showing the complete destruction of all exploiting classes.

Regarding the industrial development, the authors state that during the fifth Five-Year Plan (from 1951-1955) the average rate of production increase per year was 13.2 % in industrial gross production. Similar statistical data are given regarding the manufacture of means of production, of consumer goods, of the growth in metals, coal, oil, and cement production. The authors point out the trend to move Soviet heavy industry eastward, to the Urals, Siberia, Central-Asia and Kazakhstan. Further data are given to illustrate the Soviet progress in machine-tool construction, in the production of different instruments and automation means.

Relating to agriculture, statistical figures are given to

Card 1/2

illustrate the production increase of basic foodstuffs and the development of agricultural mechanization. The cultivation of virgin and waste lands (altogether 36 million ha) in Kazakhstan, in the Urals and in Siberia is said to have been a big economical success.

The article contains also statistical figures showing the improved living standard of the Soviet population, the better conditions of work, the achievements in house-building. Other data refer to public education and the enormous output of technical experts.

AUTHOR: Volodarskiy, L. SOV-2-58-7-2/14

TITLE: A New Phase in Organizing the Planning and Tasks of Statistics (Novyy etap v organizatsii planirovaniya i zadachi statistiki)

PERIODICAL: Vestnik statistiki, 1958, Nr 7, pp 12 - 19 (USSR)

ABSTRACT: The economic decentralization which started after the 20th Conference of the Communist Party charged the Soviet statisticians with the important task of organizing centralized accounting and statistics. On the basis of accounts submitted by sovnarkhoz and other authorities, the Central Statistical Administration is working out general indices and statistical materials characterizing the work and development of the most important branches in the national economy. This statistical data enables the government, the Tsentral'nyy Komitet partii (Central Committee of the Party), the USSR Gosplan and the state committees of the USSR Council of Ministers to initiate long-term planning. There is 1 Soviet reference.

AUTHOR: Volodarskiy, L. SOV/2-58-12-3/19

TITLE: The Grand Industrial Development Program of the Soviet Union (Velichestvennaya programma razvitiya promyshlennosti Sovetskogo Soyuza)

PERIODICAL: Vestnik statistiki, 1958, Nr 12, pp 19 - 29 (USSR)

ABSTRACT: The forthcoming 7-Year Plan (1959 to 1965) foresees a great development in Soviet economics, and in particular in heavy industry. The decisive branches of the Soviet industry will increase their production by 2 to 3 times within the next 15 years. As compared with 1957, the iron ore output must increase approximately by 3.5 times, the recovery of oil by 4 times, the recovery and output of gas by 13-15 times, the production of cast iron and steel by 2.3 times, of electric power by 4.3 times, of cement by 4 times, etc. The new 7-Year Plan foresees the industrial exploitation of iron ore deposits in Siberia and Kazakhstan, where a third powerful metallurgical base is under construction. From 1959 to 1965 it is projected to build and put into production smelters which will produce 24-30 million tons of cast iron, 28-36 million tons of steel and from 23 to 29 million tons of rolled iron. The output of aluminum will be increased by approximately 2.8 times, that of refined copper by 1.9 times.

Card 1/3

The Grand Industrial Development Program of the Soviet Union

The output of nickel, magnesium, germanium, silicon and other non-ferrous, and in particular, rare metals will also be considerably increased. Utmost attention will be paid to the development of the chemical industry; the total production volume is to be increased by 3 times, in particular the production of chemical and synthetic fiber, of plastic materials and synthetic resins. In 1965, oil recovery will rise to 230-240 million tons, i.e. more than 2 times as compared with 1958. The production of coal will exceed by 20-23%, the output in 1958. A number of new atomic electric power plants with various reactor types will be put into action. The machine construction industry is to double its production; the latest achievements in science and engineering, such as radio-electronics, superconductivity, ultrasonic waves, radioactive isotopes, semiconductors, nuclear energy, etc, will be applied in machine construction. The estimated production increase in heavy industry and agriculture will ensure a fast development of light industry. The 7-Year Plan will benefit the economic development of the eastern areas of the USSR (the Urals, Siberia, Central Asia,

The Grand Industrial Development Program of the Soviet Union

Trans-Caucasia etc.). In 1965 the USSR total production in some important production branches will surpass, and in other branches approach the present production level of the US. After 1965, the USSR will need 5 more years to reach and surpass American per capita production. There are 4 tables.
