680. STUDIES ON THE CORNEAL AND TRABECULAR ENDOTHELIUM. II. ENDOTHELIUM OF THE ZONE OF TRANSITION - Vrabeč F. First Eye Clin., Univ. of Prague - BRIT. J. OPHTHAL. 1958, 42/11 (667-673) Illus. 5

Eyes of cats, rabbits and chesus monkeys, some human eyes with different pathological conditions, and one human eye which was clinically normal but was enucleated because of an orbital tumour, were studied. The basic method used was the silver impregnation method of McGovern (1955, 1956). The results were compared with those obtained by the replica and pseudo-replica methods, the latter mostly with additional staining. Even in the apparently normal eye, the possibility of functional changes in the secretion of the cement substance as well as the covering substance should be borne in mind. The specimens used were either frozen sections or teased preparations; most of them were mounted in Apathy's syrup to prevent excessive dehydration and shrinkage of the cement substance; some specimens mounted in Canada balsam showed that the cement substance seems much more resistant to dehydration after impregnation with silver. The endothelial covering of the zone of transition in the region of the anterior border of Schwalbe's ring is described. The peculiar fan-shaped groups of endothelial cells at the periphery of the cornea are closely related to the anterior anchorage of the ciliary muscle tendons. The endothelial elements immediately posterior to the margin of Descemet's membrane are conspicuously enlarged. The fact that the outlines of the cells are preserved in the endothelium of the zone of transition (in the superficial as well as in the deeper layers) may have some bearing on the control of the flow of aqueous humor to the corneal stroma through the sheaths of the trabecular meshwork. Excellent microphotographs.

1170. VRABEC Fr. 1re Clin. ophtalmol. Univ. de Prague. *Sur les rapports des fibres nerveuses régénérées de la cornée humaine avec les kérateblastes.
The relationships between regenerated nerve fibres of the human cornea and keratoblasts OPTHALMOLOGICA (Basel) 1955, 130/1 (24-31) Illus. 4

In various pathological conditions of the uvea - inflammations, tumours and especially melanoblastoma of the choroid - clinically intact and clear corneas may show excessive hypertrophy of the nerve fibres, attributable to irritation of the nerves in the suprachoroidal and supraciliary spaces. Newly formed nerves, situated in the superficial layers of the corneal stroma, mostly show the shape of a loop or a

1170 CONT

cluster and are often deprived of Schwann's sheath. The author observed a different form of fibre, remarkably broadened to a flat ribbon. The newly-formed nerve fibres show reinforcements opposite the nuclei of the keratoblasts, towards which the ribbon-shaped fibres sometimes send amoeboid expansions. The impression is gained that the nerve fibre proper, without the protective and nutritive Schwann's sheath, owing to the expansions of its prefibrillar plasma, participates in the metabolism of the keratoblasts. It may also be supposed that there is, on the contrary, a phenomenon of degeneration and absorption of the nerve fibres by the keratoblasts. However, this hypothesis is refuted by many arguments, in particular by the appearance and the calibre of the ribbon-shaped fibres. It is established that there are close direct relationships between the newly-formed fibres and the keratoblasts, which explain a large number of phenomena, such as oedema of one half of the cornea, the discrepancy between ocular pressure and corneal oedema in treated acute glaucoma, etc.

In numerous normal and pathological human corneae the author was able to find a nerve net, which he considers to be identical with Hoyer's plexus subbasalis corneae. This plexus is only to be found in cases of pathological innervation of the cornea. For this reason the author is of opinion that the term plexus subbasalis should be eliminated from the nomenclature of the normal innervation of the human cornea. (1, 4, 12)

Report on a rare malignant epithelioma of the ciliary body issuing from the non-pigmented layer of the epithelium and invading the ciliary body. Its minute structure, as is typical of this type of growth, consisted of single-layered cylindrical epithelium in which melanine formation could be proved by silver impregnation. In the area of infiltration into the corpus ciliare the tumour was formed by solid clumps of malignant type.

OPHTHALMOLOGICA (Basel) 1954, 128/6 (359-364) illus. 4
The author studies the innervation of the angle of the anterior chamber in man and various vertebrates. The nerves come from the supraciliary space and from the nerves of the ciliary body; they form in the trabecular system a rich nervous plexus of complicated structure. One can find sensitive nerve endings and in birds Herbst's tactile bodies.

Examination of the cyclopic eyeball of a 25-mm. human foetus removed for extra-uterine pregnancy showed the following anomaly: the lens anlage had been pushed forward by mesodermal tissue; as a consequence, it closed the opening of the primitive vesicula and made contact with the epithelium of the corneal anlage.

Title : The Influence of the Time of Year on the Motor Activity of the Intestine (An Experimental Investigation).

Orig Pub: Studii si cercetari endocrinol. Acad. RPR, 1956, 7, No 4, 439-449.

Abstract: In rabbits during the summer the capacity for establishing conditioned intestinal motor reflexes increased, as did the sensitivity of interoceptors and nervous centers to acetylcholine; at the same time the excitability of the intestine decreased. In the winter, on the other hand, the excitability

TITLE: Techirghiol mud as an ion exchanger B

SOURCE: Revista de chimie, v. 15, no. 10, 1964, 637-640

TOPIC TAGS: ion exchange, electric potential

ABSTRACT:

The authors tested the mud from Techirghiol Lake by various methods, and particularly by the recording of the electrical potential during ion exchanges. The mud was found to possess ion-exchanging qualities for lower-valence ions, especially Ca^{++} , Mg^{++} , Fe^{++} , and K^{+} . It behaved like synthetic ion exchangers when subjected to regeneration with a sodium chloride solution. Orig. art. has: 3 tables, 2 figures, 1 graph.

TITLE: Kinetic study concerning the electrical effects during the ion exchange of
some granular cationites [Presented at the Republic Chemistry Symposium at Iasi,
1964]

SOURCE: Revista de chimie, v. 16, no. 1, 1965, 35-39

TOPIC TAGS: ion exchange, chemical kinetics

ABSTRACT: An analysis of the kinetic processes occurring during the ion exchange of water-softeners of the cation type under the influence of voltages of 0 to 90 volts of continuous and alternating current. The effect of the voltage in terms of the concentration of the solution flowing over the cationite is studied and compared to the effect with distilled water, and some electrokinetic processes and their possible interaction in the ion-exchange process are discussed. Orig. art. has: 8 figures. [Based on authors' Eng. abstract] [JPRS]

INST. : Bucharest Institute of Petroleum and Gas
TITLE : Rapid Determination of Phosphoric Acid in
Kola Apatite and Bone Meal by the Method
of Copaux.
ORIG. PUB. : Lucrarile Inst. petrol si gaze Bucuresti,
1957, 3, 345-352
ABSTRACT : For determination of P_2O_5 in apatite and bone
meal, use is made of the method of Copaux (Copaux H., C. R.
des Seances de l'Acad. des sciences, 1921, 173, p. 656),
based on formation of ether-phosphomolybdic acid complex
in an acidic medium (pH 0.45-0.65). The latter, after
centrifugation, is separated from excess ether and water,
as a yellow, oily liquid, the volume of which depends on
 P_2O_5 content of the sample. To the sample being analyzed
(5 g) are added 10 ml concentrated HNO_3 and 50 ml concen-
trated H_2SO_4 , the mixture is evaporated until SO_3 -fumes
are evolved, cooled, 200 ml water are added, heated to a
boil, cooled, diluted with water to 500 ml, and filtered.
