TITLE: A bolometric pyr heliometer for absolute measurements of direct solar radiation. (O Bolometrisheskom pirgeliometre dlya absolyutnykh izmereniy pryamoy solnechnoy radiatsii)

PERIODICAL: "Astronomicheskiy Zhurnal" (Journal of Astronomy), 1957, Vol. 34, No. 3, pp. 490-492 (U.S.S.R.)

ABSTRACT: A pyr heliometer based on the bolometric principle is described. Basically, it consists of an 0.05₂mm thick copper ring having a receiving area of 0.5 to 1.0 cm², and a resistance of 10 Ω approx. The ring is blackened and absorbs approx. 98% of the incident radiation. The ring is included as one arm of a Wheatstone bridge, the other three arms being of known resistance. The ring is covered, balance is established in the bridge, and the current i_0 through the bolometer is measured. The ring is then exposed to radiation and balance is re-established by adjusting a rheostat in series with the driving battery (the arms of the bridge remaining unaltered). If the current through the ring is now i_r then it can easily be shown that the intensity of solar radiation I is given by:

Card 1/2

33-3-26/32

A bolometric pyr heliometer for absolute measurements of direct solar radiation. (Cont.)

$$I = \frac{14.35r}{S\sigma} (i_T^2 - i_0^2)$$

where S is the exposed area and σ is the absorptivity. If $S\sigma$ is known, it is possible to determine I absolutely.

This pyr heliometer has several advantages over Angstrom's compensated pyr heliometer. In a series of experiments the latter instrument gave readings 1.4% lower (on the average) than the pyr heliometer now reported.

There are 2 figures and 4 Slavic references.

AUTHOR: V'yushkov, P. V.; Sklyarov, Yu. A.

TITLE: A bolometric pyrhelimeter as a reference instrument for absolute measurements of direct solar radiation

SOURCE: Astronomicheskij zhurnal, v. 41, no. 3, 1964, 555-558

TOPIC TAGS: bolometric pyrhelimeter, micrometric screw, black body, radiation receiver, resistance power, instrumental error, angstrom pyrhelimeter

ABSTRACT: A new model of the Sklyarov bolometric pyrhelimeter has been designed in which all defects of the previous model have been eliminated. The receiver tube which contains the radiation receiver is mounted on a stand. The stand has micrometer screws and an aiming device. Behind the radiation receiver is a chamber which represents a model black body and absorbs the light passing through the receiver. The radiation receivers are made of different kinds of copper wires with various resistance power. The electrical part of the pyrhelimeter is located in a special box. Formulas are

Card 1/2

ACCESSION NR: AP4040847

developed for determining instrumental errors. The new model bolometric pyrhelometers were compared with the USSR standard No. 212 Ångström pyrhelometer. The agreement of results was good, which shows reliable reproducibility of their scales. The bolometric pyrhelometer has a number of advantages over the Ångström pyrhelometer. TITLE: The velocity of ultrasound in liquid aluminum

SOURCE: Ukrains'kyy fizichnyy zhurnal, v. 11, no. 4, 1966, 440-441

TOPIC TAGS: ultrasound, ultrasonic velocity, interferometer, aluminum, adiabatic compression, standing wave, nonferrous liquid metal, potentiometer/EPP-09 potentiometer

ABSTRACT: The authors study the speed of ultrasound in liquid aluminum as a function of temperature. All measurements were taken with a high-temperature interferometer consisting of a vertical tubular crucible with a rod made from the material to be studied. The rod is placed within the crucible and its lower part is water-cooled. An ultrasonic emitter is attached to the lower section of this rod. The upper part of the rod melts as the crucible is heated and a reflector is immersed in the melt. Standing waves are formed at the moment of melting and stress on the emitter varies. These variations are recorded on the EPP-09 electronic potentiometer. Both the crucible and the reflector are made from graphite during the first stage of the study, and from aluminum for the second stage. A chromel-alumel thermocouple was used for temperature measurement. The thermocouple was fixed in the frame of the reflector

3

approximately 1 mm from its surface. The rod specimens for the study were made from AV000 99.99% pure aluminum 20 mm in diameter and 400-450 mm long. The melt was maintained at a height of 60-120 mm depending on temperature. Once the reflector was immersed, it was left for the entire series of experiments to avoid formation of aluminum oxide. The speed of ultrasound at each temperature was determined by averaging 20-25 measurements. The results show that the speed of ultrasound in liquid aluminum is a linear function of temperature. Extrapolation shows a velocity approaching 4730 ± 25 m/sec at the melting point with a temperature coefficient approaching 0.16 m/sec·deg. The coefficient of adiabatic compression approaches $1.88 \cdot 10^{-12}$ cm²/dyne at the melting point, and $2.0 \cdot 10^{-12}$ cm²/dyne at 1000°C. The coefficient of adiabatic compression is a nearly linear function of temperature. The experimental data for AD1 aluminum agree with those for AV000. Orig. art. has: 1 figure.

TITLE: Thermomechanical working and structural changes in steels

SOURCE: Fiziko-khimicheskaya mekhanika materialov, no. 4, 1965, 449-454

TOPIC TAGS: steel structure, mechanical heat treatment, thermomechanical property

ABSTRACT: The effect of thermomechanical working on mechanical properties of 45-, 35Kh-, and 60S2 steel brands was studied at frequencies of torsional deformation varying from 0 to 5000 and torsion amplitudes varying from 0 to 1.105. The steel samples were heated to 840°-900°C, mechanically deformed, quenched in oil, and tempered for 2 hours at 150°-200°C. For all three steels, an increase in torsion amplitude resulted in a shift of the maximum mechanical strength and hardness toward smaller frequencies. The heat-vibration-treatment of the steel has little effect on its plasticity. Some loss in plasticity was observed at very high frequencies of torsional deformation. A maximum steel hardening resulted from tempering at 150°-200°C. The duration of tempering had little effect on steel strength. In the case of 35Kh/steel, within 840-900°C range, temperature of deformation does not af-

Card 1/2

L 1337-66

ACCESSION NR: AP5022400

fact the mechanical strength; however, use of higher temperature resulted in a gain in steel plasticity. The maximum mechanical strength resulting from this treatment is accompanied by some loss in density of martensite domains. Some increase in density of martensite domains occurs at torsional deformation frequencies greater than that corresponding to maximum mechanical strength. This is, however, accompanied by the appearance of an increasing number of microcracks in the steel. Orig. art. has: 3 figures, 2 tables, 4 formulas. ⁴

TITLE: Effect of heat and vibration treatment on shear strength and endurance of bits made of R18 steel

SOURCE: Fiziko-khimicheskaya mekhanika materialov, no. 4, 1965, 465-467

TOPIC TAGS: mechanical heat treatment, shear strength, endurance test, steel/ R18 steel

ABSTRACT: R18 steel containing 0.9% C, 18.2% W, 4.1% Cr, 1.1% V, and 0.2% Mo was used in the study. The bits diameter was 9 mm and the drill rod's diameter was 15 mm. The treatment procedure involved heating to 1260°C, cooling in air to 450-600°C, cyclic torsional deformation, and quenching in oil. The treatment equipment was described in the literature (I. V. Vyval' and O. N. Romaniv, *Vliyaniye rabochikh sred na svoystva materialov*, 1964, vyp. 3 [Effect of Operating Media on Properties of Materials, 1964, No. 3]). The shear strength was examined on a vertical drill at a constant feed rate of 0.11 mm/revolution using type-45 steel. The cutting rate varied from 8.2 to 16.1 m/min. Maxima of bit endurance occurred at

Card 1/4

L 1335-66

2

n = 500 and $\alpha = 2^\circ$ and n = 300 and $\alpha = 4^\circ$. Highest steel bit endurance resulted when the treatment was carried out at 450°C. The treatment has no effect on the red hardness of R18 steel. The effect of tempering temperature on bit hardness is shown in fig. 1 of the Enclosure. The microhardness H_v distribution on bit's profile after the shear strength test is shown in fig. 2 of the Enclosure. Orig. art. has: 2 figures, 1 table.

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 2, no. 4, 1966, 474-478

TOPIC TAGS: high carbon steel, cyclic stress, high temperature effect, cyclic strength, thermomechanical property

ABSTRACT: The mechanical properties under cyclic stress of the steels 9KhS (0.92% carbon) and ShKh15 (0.98% carbon) were determined after heat treatment at 850 C under applied torque. The treatment resulted in anisotropic properties, as shown in asymmetric stress cycles by an increase in strength and plasticity under direct static load, i. e., in the direction of torque applied during treating. The strength increase was up to twice the value measured on the control specimen, whereas the strength in the inverse direction of stress decreased.

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 2, no. 2, 1966, 227

TOPIC TAGS: stress corrosion, corrosion resistance, metal property, steel/ 40Kh steel

ABSTRACT: The effects of surface heat treatment with high frequency current (HFC) on the surface corrosion cracking of 40Kh steel were investigated, and the results are very briefly reported. It was found that HFC surface hardening increased the static corrosion resistance (in 20% H₂SO₄, 100 hours) to 60 dynes/mm², i.e., twice that obtained for volume hardening of the specimens. The most effective surface treatment was found to be volume hardening and annealing (at 200C to HRC = 48--50) of the specimen followed by HFC surface annealing (to HRC = 27--30). The static corrosion strength of these specimens reached 115--120 dynes/mm².

TITLE: On the Mechanism of Fat Biosynthesis in Maturing Flax Seeds. (K Voprosu O Mekhanizme Biosinteza Zhira v Sozrevayushchikh Semenakh L'na.)

PERIODICAL: Ukrainskiy Khimicheskii Zhurnal, 1957, Vol. 23, No.1, pp. 85 - 88 (USSR).

ABSTRACT: The distribution of radioactive carbon C^{14} was investigated in fractions of glycerine and fatty acids separated from fats of flax seeds. The transformation of saccharose C^{14} of pyruvic acid-2- C^{14} , acetic acid-1- C^{14} and glyocol-1- C^{14} into fat components, e.g. glycerine and fatty acids of ripening flax seeds was tested by various experiments. The radioactivity of aqueous fractions, of fatty acids and of glycerine is illustrated by graphs 1 - 3. It was shown during the investigations that the acetyl-coenzyme A is synthesised directly from acetic acid and also during the metabolism of carbohydrates and oxidation-reduction processes of acids and aldehydes, e.g. of pyruvic acid. Obviously, the participation of these and other compounds during the synthesis of the acetyl-coenzyme A are linked with the characteristics of the organism or of the living tissues in which these processes take place. TITLE: On the mechanism of cellulose biosynthesis in developing flax stems. (K voprosu o mekhanizme biosinteza tsellyulozy v formiruyushchikhsya steblyakh l'na).

PERIODICAL: "Ukrainskiy Khimicheskiy Zhurnal" (Ukrainian Journal of Chemistry), Vol.23, No.2, March-April, 1957, pp.233-235 (USSR).

ABSTRACT: Previously published investigations (1) proved that cellulose is formed in higher plants and some microorganisms at the expense of glucose which is synthesised by these organisms. Experiments carried out by Gritkhaus concerning the study of the biosynthesis of cellulose of cotton fibres. By incising the stem immediately under the boll glucose-1-C¹⁴ was injected. The thus treated boll ripened in 30 days. Investigations of the distribution of radioactivity showed that 99.97% of the total activity of this sugar occurs in the first C atom. The author concluded that cellulose in cotton fibres is formed by the direct polymerisation of glucose molecules by utilising the energy of phosphorylation. The authors attempted to elucidate the action of saccherose C¹⁴, acetic acid-1-C¹⁴, glycine-1-C¹⁴

Card 1/2

On the mechanism of cellulose biosynthesis in developing flax stems. (Cont.)

and pyruvic acid-2-C¹⁴ during the synthesis of cellulose in flax stems. Labelled saccharose-C¹⁴ and glycine-1-C¹⁴ were proved to impart the highest activity. The distribution of radioactivity in cellulose fractions extracted from bast and flax stems is shown in Diagrams 1 and 2. It can be seen that the C¹⁴ atoms pass into the cellulose molecules in various quantities. It is suggested that glycine transforms to d-glucose via the formation of triose.

TITLE: ~~.....~~ Determining Power Curves of Hydraulic Leaps

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1959, Nr 10, pp 48-50 (USSR)

ABSTRACT: The article is a contribution in the section devoted to readers' comments, and deals with a method of calculating the power curves of hydraulic leaps. The formula for determining the combined depths of the hydraulic leap of a horizontal riverbed of rectangular cross-section is

$$\eta = \frac{h_2}{h_1} = \frac{1}{2} (\sqrt{1 + 8\pi_1} - 1), \quad (1)$$

which is formed by the equation of the impulses set up for 2 cross-sections - one before the leap and one at a certain distance beyond it. The kinetic energy P_1 of the cross-section before the

Card 1/4

leap is calculated according to the formula

SOV/98-59-10-13/20

Determining Power Curves of Hydraulic Leaps

$$P_1 = \frac{v_1^2}{2g} = \frac{q^2}{gh_1^3} = \frac{h_{kr}^3}{h_1^3} = \left(\frac{1}{\xi_1}\right)^3, \quad (2)$$

where the critical depth $h_{kr} = \sqrt[3]{\frac{q^2}{g}}$ and the ratio $\frac{h_1}{h_{kr}} = \xi_1$.

The approximate accuracy of these calculations is borne out by Professor M.D. Chertousov's graph (Ref.1). Variations in the results of theoretical and practical calculations of the value η have led to some authorities formulating such functions as

$$\eta = A\sqrt{P_1}, \quad (3)$$

but the best results are obtained by means of the formula

$$\eta = .95 \sqrt{2P_1} = \sqrt{1.6P_1} = \frac{4}{3} \sqrt{P_1}. \quad (4)$$

It has recently been established by the VNIIG (All-Union Scientific Research Institute of Hydraulics), SANIIRI (Central Asian

Card 2/4

SOV/98-59-10-13/20

Determining Power Curves of Hydraulic Leaps

Scientific Research Institute of Irrigation), AN UzSSR (AS UzSSR), etc., that immediately beyond the vortex zone the values of the kinetic energy correctives α_o and α vary considerably from the unit, and that beyond it there is an area where speeds and pressures are leveled out. In conjunction with L.A. Mashkovich, the author expresses the correctives $(\alpha_o)_n$ and α_n in the cross-section immediately beyond the vortex zone as $(\alpha_o)_n = \sqrt[3]{\eta}$ (5)

$$\text{and } \alpha_n = 3 \sqrt[3]{\eta - 2} ; \quad (6)$$

these results are borne out by D.I. Kumin (Ref.9) and A.A. Kadyrov (Ref.7). From the functions (6) and (4) we obtain

$$\alpha_n = 3 \sqrt[6]{1.8P} - 2 \approx \frac{3.33}{\sqrt{\xi_1}} - \eta , \quad (7)$$

and, similarly, from (5) and (4) we obtain $(\alpha_o)_n = \frac{1.11}{\sqrt{\xi_1}}$. (8)

Card 3/4

Fig.1 shows a graph illustrating the relation of $(\alpha_o)_n$ and α_n

SOV/98-59-10-13/20

Determining Power Curves of Hydraulic Leaps

and ξ_1 and η , and the curve $\xi_2 = f(\xi_1)$ according to the equation (4), where $\xi_2 = \frac{h_2}{h_{kr}}$. From the graph the power curve of the

streamflow at the cross-section n-n of the hydraulic leap can easily be calculated. Tests by Professor D.I. Kumin and Professor I.I. Levi have shown that at the commencement of flooding the value α_n changes, at first decreasing, and the increasing again. The author remarks that this field has yet to be properly researched, particularly in the case of dampers being used. Present data show that the graph in fig.2 accurately records the changes (α_n) in the cross-section n-n; in cross-sections situated lower downstream than n-n, α decreases according to the function $\alpha = f(\alpha_n, \lambda, n)$, where n is the coefficient of roughness. There are 2 graphs and 16 references, 15 of which are Soviet, and 1 East German.

TITLE: On the Erosion of a Rocky Bed Downstream of a Dam and a Methodology for Its Investigations (With Reference to Papers by Abelev and Kruchinina) [O razmyvakh skal'nogo rusla za plotinami i o metodike ikh issledovaniy (po povodu statey Abeleva i Kruchininoy)]

PERIODICAL: Izv. AN UzSSR, 1956, Nr 3, pp 103-108

ABSTRACT: The paper demonstrates that the methodology of model simulation of local erosion of rocky soil near dams used in the experiments of A.S. Abelev and A. A. Kruchinina (see RZhMekh, 1955, abstract 3016) suffers from a number of basic defects. The substitution of rocky soil in the model by gravel is arbitrary, since it does not reflect the true picture of the effect of a flow on a rocky soil. The author adduces some interesting and detailed results of the operation of a specific dam and points out their considerable divergence from the results of the laboratory experiments of Abelev conducted for the investigation of erosion on a model of the same dam. In analyzing the description of similar laboratory investigations on local erosion conducted on the

Card 1/2

SOV/124-57-4-4284

On the Erosion of a Rocky Bed Downstream of a Dam (cont.)

models of a certain other dam the author notes the presence of still other deficiencies in the methodology of the experiments (an arbitrary selection of soils, the failure to take into account a number of properties and characteristics of the flow in the area of the spillway and the tail water, etc.). In order to prove the flaws in the methodology of the model simulation of local erosion the author also submits certain theoretical considerations substantiated by formulas suggested for local erosion but fails to notice the structural flaws of these formulas which have led him to certain erroneous conclusions. Bibliography: 8 references.
