TITLE: Synthesis of the isotope of mass 256 of the 102-nd element (lawrencium)

SOURCE: Atomnaya energiya, v. 18, no. 2, 1965, 109-113

TOPIC TAGS: lawrencium, transuranium elements

ABSTRACT: After a brief review of the discovery, in 1961, of lawrencium of an isotope mass 257, the authors present the results of their own identification of a new isotope of mass 256 of the same element. The experiments were conducted at the Joint Institute for Nuclear Research, in Dubna, by using the interior beam of multiply charged ions of the 3-meter cyclotron. The new isotope was synthesized from the nuclear reaction of  $^{213}_{85}\text{Am}(\text{sO}^{19}, 5n)$   $^{103}_{103}\text{Lw}^{256}$ . The isotope was identified by the  $^{100}_{100}\text{Fm}^{253}$  isotope. This end product was obtained as a result of a  $^{109}_{109}\text{Mv}^{253}$  electron capture and a  $^{103}_{103}\text{Lw}^{256}$  alpha decay. The new 256-isotope was identified by the same method which had been used by the authors for the identification of the isotope 256 of the 102-nd element (Atomnaya Energiya, 16, 195 (1964)). The arrangement used for the synthesis of  $^{103}_{103}\text{Lw}^{256}$  and the build-up of  $^{100}_{100}\text{Fm}^{253}$  is schematically illustrated in the Card 1/3

article. Spectrometers having a resolution of about 60 keV and a very low background were used. The experiments involved bombarding (8 to 12 hours) a  $^{243}\text{Am}$  target with accelerated  $^{16}\text{O}$  ions. The alpha-spectrum of accumulated Fm-products is graphically presented. The half-life of alpha activity at  $E=7.04$  MeV was about 25 hours. It was experimentally shown that the  $\sigma \times 10^{-32}$  sq cm cross-section needed for the formation of Lw-256 isotope was attained at the energy level of 96 MeV. The experiments measuring the half-life of the 256-isotope are described. The half-life time was close to 45 sec. In conclusion, the radioactive properties of this new isotope were summarized and the character of the cross-section of the reaction  $^{243}\text{Am}(^{16}\text{O}, 5n)_{102}\text{Lw}^{256}$  was evaluated. The authors wish to acknowledge with gratitude the assistance given to them by G. N. Flerov (general consultation), A. N. Ellington (cyclotron operation), L. Kumpf and A. M. Sukhov (electron equipment), A. G. Pil'kov (mechanical arrangements), E. Z. Ryndina and V. M. Kushniryuk (semiconductor detectors), V. I. Kuznetsov, A. G. Korlov and A. P. Smirnov-Averin (general assistance). The last two persons belonged to

TITLE: Synthesis of the isotopes of element 102 with mass number 256

SOURCE: Atomnaya energiya, v. 16, no. 3, 1964, 195-207

TOPIC TAGS: element 102, mass number 256, nuclear reaction, transurium element, decay period, energy dependence, U sup 238

ABSTRACT: In the nuclear reaction  $U^{238} (Ne^{22}, 4n)102^{256}$  (a-active isotope of element 102 with mass number 256) is synthesized. The registration and identification of the isotope is made according to the daughter isotope  $Fm^{252}$ . The measured half-life period of  $102^{256}$  is about 8 sec. The energy dependence of the cross section for the formation of isotope  $102^{256}$  in the reaction  $U^{238} / Ne^{22}$  is studied. Its maximum is in the area of 112 Mev. The cross section at the maximum reaches about  $4.5 \times 10^{-32} \text{ cm}^2$ . The work was carried out in an internal beam of the trimeter cyclotron of the nuclear reaction laboratory of the Joint Institute for Nuclear Research. "In conclusion, we are deeply grateful to

TITLE: Production of Pu-242 and Cm-242 from neutron-irradiated Am-241

79, 25  
B

SOURCE: Radiokhimiya, v. 7, no. 4, 1965, 453-461

TOPIC TAGS: plutonium, curium, americium, extraction, neutron irradiation

ABSTRACT: Irradiation of Am-242 with thermal neutrons produces Pu<sup>242</sup>, Cm<sup>242</sup> and Am<sup>243</sup> which are of great interest in a number of physical and radiochemical investigations. The synthesis scheme is as follows:

Card 1/2

L 00037-66

ACCESSION NR: AF5020306

0

The thermal neutron cross section of  $Am^{241}$  is 900 barn, thus even upon short irradiation with a high density thermal-neutron beam a significant amount of the above isotopes may be produced. It can be seen from the above process that the yield of fission products is small since they are produced mainly during fission of  $Am^{242}$ . This facilitates the chemical processing of irradiated substances. Production of  $Pu^{242}$  by this process requires much less time than the method which uses  $Pu^{239}$  as starting material. The authors describe the chemical separation of  $Pu^{242}$ ,  $Cm^{242}$  and  $Am^{243}$  from irradiated  $Am^{241}$ . The scheme for the chemical processing was selected to be such that it would produce rapid separation of the products. The main separation steps involved chromatographic and chemical extraction methods. Chromatographic separation was made extremely difficult by high  $\alpha$ -activity due to the presence of  $Cm^{242}$ . Chemical processing was carried out in a shielded area on a special stand with remote control of all operations. The article indicates some properties of curium oxalate, potassium curium sulfate, curium hydroxide and curium carbonate. Orig. art. has: 5 tables and 3 figures.

TITLE: Decrease in the strength of ice with time

SOURCE: Ref. zh. Geofizika, Abs. 12V328

REF SOURCE: Tr. koordinats. soveshchaniy po gidrotekhn., vyp. 23, 1965, 89-99

TOPIC TAGS: glaciology, ice strength, dynamometer, ice rheology, elasticity, rheologic property, ice, plastic deformation, plastic strength

ABSTRACT: A new method of determining the rheological properties of ice using a dynamometric device is examined. The purpose of the method is to accelerate and simplify testing procedures. The test is conducted by measuring the initial load applied to the specimen from the tension on an elastic dynamometer. The stress transmitted to the sample through the dynamometer, produces in the sample creep deformation which, in turn, causes the dynamometer to relax and reduce the stress. The reduction of stress will continue, under any given stress, until the sample's deformation achieves stabilization, i. e., until a state of equilibrium is attained between the load applied to the sample through the dynamometer and the

Card 1/2

UDC: 551.32:53

ACC NR: AR7004111

internal resistance of the ice. If the initial strain applied to the sample is approximately equal to the assumed-instantaneous strength, then the stabilization of deformation will correspond to the limiting equilibrium. Since ice does not have stress-rupture strength, a nominative value of relative deformation for a specific length of time may be regarded as the deformation stabilization. Dynamometer testing may be regarded as creep tests with stress varying with time; changes in stress and deformation are interdependent. The proposed method is recommended for conducting tests under different loads (compression, rupture, shear). In conclusion, data obtained in testing samples of polycrystalline glacier and lacustrine ice (Mirnyy, Antarctica), using the dynamometer, are presented. A bibliography of 5 titles is included. G. Deyev. [Translation of abstract]

ABSTRACT: The results are given of the gasification of Silesia coal semi-coke in a gas generator for the gasification of lump fuel with the discharge of slag in liquid form. Vapor-oxygen (VO) and carbon dioxide-oxygen blowing was used. When using VO blowing a gas is obtained with a total CO and H<sub>2</sub> content of up to 97%, whereby the gasification of the 10 - 50 mm fractions in the fuel is possible. The use of carbon attains the same value as it does

TITLE: Study of solutions by high-frequency methods. VI.  
Dispersion effects in electrolyte solutions in a wide  
frequency range of the electromagnetic field.

PERIODICAL: Zhurnal fizicheskoy Khimii, v. 37, no. 3, 1963, 544-552

TEXT: A non-resonance circuit (Fig. 4) is suggested for measuring the relaxation effects in electrolytes. Measurements were conducted by using the equations  $U_3 = \dot{U}k_{br}/Y_{sol}$  or  $Y_{sol} = \dot{U}k_{br}/U_3$ , where  $k = k_2k_1/k_1k_2$ ,  $U$  = voltage,  $Y$  = conductivity, the index  $br$  being related to the resistance box of the bridge and  $sol$  to the electrolyte solution. Measurements with frequencies up to 200 Mc/sec yielded a stepwise course of the curve electroconductivity versus concentration for  $KCl$ ,  $MgCl_2$ , and  $AlCl_3$ . This is explained by steric hindrance effects on reformation of the hydrate complexes with a certain lifetime. Shortlived hydrates are found at

Card 1/2

Study of solutions by high...

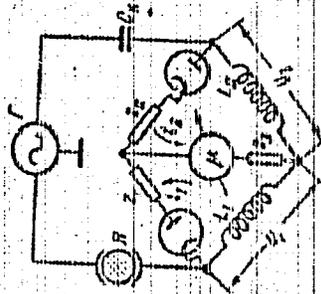

S/076/63/037/003/004/020

TITLE:

Concerning the Content of Radioactive Elements Found in waters of Oil Field Deposits (K voprosu o sodержanii radioelementov v vodakh neftyanykh mestorozhdeniy)

PERIODICAL:

Geokhimiya, 1958, Nr 7, pp 642-649 (USSR)

ABSTRACT:

The content of radium and uranium found in waters of oil field deposits was examined: radium was determined radio-chemically (Ref 3); the content of radon was measured by means of the electrometer ~~CG-12~~, the amount of uranium ascertained by luminescence. The research was conducted at the Laboratoriya yadernoy geofiziki i geologii Instituta nefti AN SSSR (Laboratory for Nuclear Geophysics of the Petroleum Institute AS USSR). Waters from wells as well as surface water from oil fields of West Turkmenia (Tables 1-3) were examined. Samples were taken from the petrol and mineral gas province of Emba (Kazakhstan) (Tables 4,5) and from oil fields in the Cis-Uralian region (Tables 6-8). Independent of the type of deposit, the radium content ranges from  $10^{-10}$  g/l, seldom under  $10^{-11}$  g/l. The uranium content seldom surmounts  $1.0 \cdot 10^{-7}$  g/l.

Concerning the Content of Radioactive Elements Found in Waters of Oil Field Deposits

The largest quantities of radium are to be found in waters of the calcium chloride type. Uranium is concentrated in waters of the sodium bicarbonate type. Radium is found in largest amounts in the marginal zones of the oil field deposits. There are 8 tables and 12 references, 11 of which are Soviet.

TITLE: A device for thermostating specimens in NMR experiments.

SOURCE: Zhurnal fizicheskoy khimii, V.38, no.4, 1964, 1030-1031

TOPIC TAGS: thermoregulator, nuclear magnetic resonance, control circuit, temperature control, gas heat exchanger, spin echo

ABSTRACT: The article describes a device, which uses gaseous heat exchangers, for thermostating specimens in experiments with spin echo. The temperature of the investigated solutions was maintained at 40 to -300 as desired. Nitrogen gas was used as a heat exchanger. Its flow was regulated by changing the current through the heater in a Dewar flask with liquid nitrogen. To minimize the consumption of nitrogen and to achieve lower temperatures, the measuring head with the specimen was separated from the poles of the electromagnet by an air gap. In addition, the poles of the electromagnet are cooled by spiral tubes, placed around the poles, through which water

TITLE: Some relations characterizing the beam path in a cesium frequency standard

SOURCE: Izmeritel'naya tekhnika, no. 12, 1966, 51-53

TOPIC TAGS: frequency standard, cesium, frequency <sup>central</sup> standard, atomic clock

ABSTRACT: Early authors' experiments with the cesium atomic-beam frequency standard involved a collimating diaphragm and were found to be unwieldy. Hence, further experiments were conducted without collimators, their functions being performed by beam slits cut in the resonators. Formulas are deduced which impose certain conditions on the widths of the slits in the resonators, source, and detector and also on the field gradient of the deflecting magnets. These conditions make possible successful operation of the frequency standard not equipped with the collimating diaphragm and having symmetrical beam deflection. These relations are derived: detector slit width

$$b_n + \frac{l_0}{l_1 + l_2 + l_3 + l_4} b_p < \frac{4M_0 \gamma B}{3m \alpha^2} l_2 \left( \frac{l_3}{2} + l_1 \right)$$

$$b_0 = 2b_n + b_n.$$

$$b_p < \left[ \frac{4M_0 \gamma B}{3m \alpha^2} l_2 \left( \frac{l_3}{2} + l_1 \right) - b_n \right] \frac{l_1 + l_2 + l_3 + l_4}{l_0}$$

Card 1/2

UDC 621.373.083.76:546.36

ACC NR: AP7002707

The beam can be limited either by the first (from the source) or by the second resonator. If  $b_n + b_p < \frac{a l_1}{\rho^2} (2l_1 + l_2)$ , the first resonator places the limitation; if  $b_n + b_p > \frac{a l_1}{\rho^2} (2l_1 + l_2)$ , the second. Here,  $b_n$  - source slit width and  $b_p$  - resonator slit width. Actually, both resonator slits act simultaneously as the beam contains atoms that have different speeds. Orig. art. has: 2 figures and 24 formulas.

**TITLE:** Thermal-mechanical treatment of steel to give high strength

**PERIODICAL:** Metallovedeniye i termicheskaya obrabotka metallov,  
1961, No.5, pp. 2-9

**TEXT:** The authors point out that recently such attention has been given to combined mechanical and heat treatment, by two possible methods. In one method the steel is rapidly deformed in the austenite-stable temperature range and quenched. While this improves the steel in many ways it fails to increase tensile strength. In the second method the steel is deformed at a temperature between the martensite point  $M_d$  and the recrystallization temperature, and quenched. This gives increased strength with satisfactory plasticity. Results of thermal-mechanical

E111/E152

Thermal-mechanical treatment of steel to give high strength treatment are not universally successful, and there are no reliable data on the practical use of the "ausform" or "ausforming" treatment widely advertised in the USA. The object of the present work was the study of thermal-mechanical treatment of alloy structural steels to a high strength and the structure produced by the treatment. The composition of the steels was as shown in Table 1, steels A-Γ being melted in induction and Δ and E in arc furnaces: the first group were austenitized at 1000, the second at 900 °C. After cooling in a nitrate bath to the deformation temperature the steels were rolled in 4-5 passes (reduction 90%), oil-quenched and tempered. To reduce cooling the work was reheated between passes and other measures taken, e.g. rolls were preheated to 100 °C. A portable magnetic instrument (developed by G.Yu. Sila-Novitskiy and T.D. Kutyskhina) was used to detect isothermal-decomposition products; if found, the specimen was rejected. After treatment specimens had a hardness Rc of 58-64 and mechanical-test pieces were prepared by spark machining and removal by grinding (temperature kept below 100 °C)

Card 2/8

S/129/61/000/005/001/003  
E111/E152

Thermal-mechanical treatment of steel to give high strength of a 0.5 mm deep surface layer. Fig.2 shows tensile strength kg/mm<sup>2</sup> and relative elongation as functions of carbon content for steels A, B, A and E after treatment (90% deformation at 550 °C, 4 hours tempering at 100 °C); for steel A tempering at 100 and 200 °C is shown by points 1 and 2 respectively, steels E and A indicated by point 3. Fig.3 shows for steel A tensile strength and elongation in relation to the 90% deformation temperature (tempering at 100 °C). The effect of variation in austenitization temperature with 90% deformation and tempering at 100 °C of steel A on tensile strength, Rockwell hardness and elongation is shown in Fig.4. Fig.5 shows the effect of tempering temperature on these properties of the normally thermomechanically treated alloys B and A (left- and right-hand graphs respectively). The treatment enabled a tensile strength of 280-300 kg/mm<sup>2</sup> and elongation of 6% to be obtained for the steels tested, which is better than with ordinary or stepwise hardening followed by low-temperature tempering. As carbon content rises to about 0.5% strength of thermomechanically treated steels rises, and falls with higher

Card 3/8, 5

X

22545  
S/129/61/000/005/001/003  
E111/E152

Thermal-mechanical treatment of steel to give high strength  
C content due to semi-brittle or brittle fracture. The best  
strength/plasticity combination was obtained with tempering at  
100 °C. In some experiments on steel 6 the deformation was  
decreased to 50%; the results were less favourable than with the  
90% deformation as regards strength, but gave high plasticity.  
The advantage of 50% deformation is that it can be effected at  
relatively high temperatures, even above the recrystallization  
temperature. Bend tests on 60 x 10 x 2 mm plates of steel 6  
heated in various ways were also carried out. Electron-  
microscopic study of the fine structure of thermomechanically  
treated steel A showed a pronounced texture and considerable  
refinement of martensite plates. X-ray diffraction by rotating  
specimens was also studied (with a JPC-50W (URS-50I) ionization  
apparatus with automatic recording of intensity distribution in  
 $F_{\alpha_1}$  radiation); block size of the thermomechanically treated  
steel was one half to one quarter that obtained with ordinary  
hardening. The authors conclude that structure refinement is one  
factor in the effectiveness of the treatment.

and 12 and 13, steel 4 remelted in a consumable-electrode vacuum arc furnace. The ausforming consisted of austenitizing at 1000°C, gas-peter bath or furnace cooling to 500°C, rolling in 5 to 7 passes with a total reduction of 90%, and oil quenching. This was followed by tempering at 100, 200, 300, or 400°C for 3 hrs. The specimens were encased in X18CrNiTi stainless steel envelopes; rolls were preheated to 80-100°C. In all steels the best combination of strength and ductility -- tensile strength  $\sigma_b$  of 380-290 kg/mm<sup>2</sup> and elongation of  $\delta = 6$  to 9% -- was obtained by tempering at 100°C. Remelted steels generally were found to have higher strength and ductility. After tempering at 100°C the induction-melted steels had a yield strength  $\sigma_{0.2}$  of 200.5 kg/mm<sup>2</sup>,  $\sigma_b = 266.5$  kg/mm<sup>2</sup>,  $\delta = 8.6\%$ . In remelted steels (except for steels vacuum-remelted in a magnetic field,  $\sigma_b$  varied from 280 to 290 kg/mm<sup>2</sup>,  $\sigma_{0.2}$  from 180 to 210 kg/mm<sup>2</sup>, and  $\delta$  from 6 to 10%. Steels conventionally hardened and tempered at 100°C in many cases showed partial brittle failure. Short-time

3031. (879) INTRA-AORTIC BLOOD TRANSFUSION (Russian text) - Yermakov  
V. S. - KHIRURGIYA 1958<sup>3</sup>, 11 (23-27) illus. 1

A series of cases is presented in which transfusions into the abdominal aorta were employed. The method was used in grave surgical shock and in blood loss. A good and stable effect was seen in 7 out of 14 patients who recovered. An effect of short duration was obtained in 2 patients. The observations show that the intra-aortic transfusion is a powerful therapeutic measure which may be employed in prophylaxis and in combating severe shock. The rise of arterial blood pressure, improvement of the cardiac activity and respiration appeared directly after the injection of the first portions of the blood. The total amount of blood injected in shock was 70-140 ml., while in shock combined with blood loss it was 250-300 ml. A special method for the intra-aortic blood transfusion, which enables to control the aortic blood pressure and, consequently, to determine the required amount of blood for the achievement of the effect is suggested.

TITLE: Synthesis of the isotope of mass 256 of the 102-nd element (lawrencium)

SOURCE: Atomnaya energiya, v. 18, no. 2, 1965, 109-113

TOPIC TAGS: lawrencium, transuranium elements

ABSTRACT: After a brief review of the discovery, in 1961, of lawrencium of an isotope mass 257, the authors present the results of their own identification of a new isotope of mass 256 of the same element. The experiments were conducted at the Joint Institute for Nuclear Research, in Dubna, by using the interior beam of multiply charged ions of the 3-meter cyclotron. The new isotope was synthesized from the nuclear reaction of  $^{213}_{85}\text{Am}(\text{sO}^{19}, 5n)$   $^{103}_{103}\text{Lw}^{256}$ . The isotope was identified by the  $^{100}_{100}\text{Fm}^{253}$  isotope. This end product was obtained as a result of a  $^{109}_{109}\text{Mv}^{253}$  electron capture and a  $^{103}_{103}\text{Lw}^{256}$  alpha decay. The new 256-isotope was identified by the same method which had been used by the authors for the identification of the isotope 256 of the 102-nd element (Atomnaya Energiya, 16, 195 (1964)). The arrangement used for the synthesis of  $^{103}_{103}\text{Lw}^{256}$  and the build-up of  $^{100}_{100}\text{Fm}^{253}$  is schematically illustrated in the Card 1/3

article. Spectrometers having a resolution of about 60 keV and a very low background were used. The experiments involved bombarding (8 to 12 hours) a  $^{243}\text{Am}$  target with accelerated  $^{16}\text{O}$  ions. The alpha-spectrum of accumulated Fm-products is graphically presented. The half-life of alpha activity at  $E=7.04$  MeV was about 25 hours. It was experimentally shown that the  $\sigma \times 10^{-32}$  sq cm cross-section needed for the formation of Lw-256 isotope was attained at the energy level of 96 MeV. The experiments measuring the half-life of the 256-isotope are described. The half-life time was close to 45 sec. In conclusion, the radioactive properties of this new isotope were summarized and the character of the cross-section of the reaction  $^{243}\text{Am}(^{16}\text{O}, 5n)_{102}\text{Lw}^{256}$  was evaluated. The authors wish to acknowledge with gratitude the assistance given to them by G. N. Flerov (general consultation), A. N. Ellington (cyclotron operation), L. Kumpf and A. M. Sukhov (electron equipment), A. G. Pil'kov (mechanical arrangements), E. Z. Ryndina and V. M. Kushniryuk (semiconductor detectors), V. I. Kuznetsov, A. G. Korlov and A. P. AUTHOR: Donets, Ye. D.; Shchegolev, V. A.; Yermakov, V. A.

TITLE: Synthesis of the isotopes of element 102 with mass number 256

SOURCE: Atomnaya energiya, v. 16, no. 3, 1964, 195-207

TOPIC TAGS: element 102, mass number 256, nuclear reaction, transurium element, decay period, energy dependence, U sup 238

ABSTRACT: In the nuclear reaction  $U^{238} (Ne^{22}, 4n)102^{256}$  (a-active isotope of element 102 with mass number 256) is synthesized. The registration and identification of the isotope is made according to the daughter isotope  $Fm^{252}$ . The measured half-life period of  $102^{256}$  is about 8 sec. The energy dependence of the cross section for the formation of isotope  $102^{256}$  in the reaction  $U^{238} / Ne^{22}$  is studied. Its maximum is in the area of 112 Mev. The cross section at the maximum reaches about  $4.5 \times 10^{-32} \text{ cm}^2$ . The work was carried out in an internal beam of the trimeter cyclotron of the nuclear reaction laboratory of the Joint Institute for Nuclear Research. "In conclusion, we are deeply grateful to

TITLE: Production of Pu-242 and Cm-242 from neutron-irradiated Am-241

79, 25  
B

SOURCE: Radiokhimiya, v. 7, no. 4, 1965, 453-461

TOPIC TAGS: plutonium, curium, americium, extraction, neutron irradiation

ABSTRACT: Irradiation of Am-242 with thermal neutrons produces Pu<sup>242</sup>, Cm<sup>242</sup> and Am<sup>243</sup> which are of great interest in a number of physical and radiochemical investigations. The synthesis scheme is as follows:

Card 1/2

L 00037-66

ACCESSION NR: AF5020306

The thermal neutron cross section of  $Am^{241}$  is 900 barn, thus even upon short irradiation with a high density thermal-neutron beam a significant amount of the above isotopes may be produced. It can be seen from the above process that the yield of fission products is small since they are produced mainly during fission of  $Am^{242}$ . This facilitates the chemical processing of irradiated substances. Production of  $Pu^{242}$  by this process requires much less time than the method which uses  $Pu^{239}$  as starting material. The authors describe the chemical separation of  $Pu^{242}$ ,  $Cm^{242}$  and  $Am^{243}$  from irradiated  $Am^{241}$ . The scheme for the chemical processing was selected to be such that it would produce rapid separation of the products. The main separation steps involved chromatographic and chemical extraction methods. Chromatographic separation was made extremely difficult by high  $\alpha$ -activity due to the presence of  $Cm^{242}$ . Chemical processing was carried out in a shielded area on a special stand with remote control of all operations. The article indicates some properties of curium oxalate, potassium curium sulfate, curium hydroxide and curium carbonate. Orig. art. has: 5 tables and 3 figures.

TITLE: Decrease in the strength of ice with time

SOURCE: Ref. zh. Geofizika, Abs. 12V328

REF SOURCE: Tr. koordinats. soveshchaniy po gidrotekhn., vyp. 23, 1965, 89-99

TOPIC TAGS: glaciology, ice strength, dynamometer, ice rheology, elasticity, rheologic property, ice, plastic deformation, plastic strength

ABSTRACT: A new method of determining the rheological properties of ice using a dynamometric device is examined. The purpose of the method is to accelerate and simplify testing procedures. The test is conducted by measuring the initial load applied to the specimen from the tension on an elastic dynamometer. The stress transmitted to the sample through the dynamometer, produces in the sample creep deformation which, in turn, causes the dynamometer to relax and reduce the stress. The reduction of stress will continue, under any given stress, until the sample's deformation achieves stabilization, i. e., until a state of equilibrium is attained between the load applied to the sample through the dynamometer and the

Card 1/2

UDC: 551.32:53

ACC NR: AR7004111

internal resistance of the ice. If the initial strain applied to the sample is approximately equal to the assumed-instantaneous strength, then the stabilization of deformation will correspond to the limiting equilibrium. Since ice does not have stress-rupture strength, a nominative value of relative deformation for a specific length of time may be regarded as the deformation stabilization. Dynamometer testing may be regarded as creep tests with stress varying with time; changes in stress and deformation are interdependent. The proposed method is recommended for conducting tests under different loads (compression, rupture, shear). In conclusion, data obtained in testing samples of polycrystalline glacier and lacustrine ice (Mirnyy, Antarctica), using the dynamometer, are presented. A bibliography of 5 titles is included. G. Deyev. [Translation of abstract]

ABSTRACT: The results are given of the gasification of Silesia coal semi-coke in a gas generator for the gasification of lump fuel with the discharge of slag in liquid form. Vapor-oxygen (VO) and carbon dioxide-oxygen blowing was used. When using VO blowing a gas is obtained with a total CO and H<sub>2</sub> content of up to 97%, whereby the gasification of the 10 - 50 mm fractions in the fuel is possible. The use of carbon attains the same value as it does

TITLE: Study of solutions by high-frequency methods. VI.  
Dispersion effects in electrolyte solutions in a wide  
frequency range of the electromagnetic field.

PERIODICAL: Zhurnal fizicheskoy Khimii, v. 37, no. 3, 1963, 544-552

TEXT: A non-resonance circuit (Fig. 4) is suggested for measuring the relaxation effects in electrolytes. Measurements were conducted by using the equations  $U_3 = \dot{U}k_{br}/Y_{sol}$  or  $Y_{sol} = \dot{U}k_{br}/U_3$ , where  $k = k_2k_1/k_1k_2$ ,  $U$  = voltage,  $Y$  = conductivity, the index  $br$  being related to the resistance box of the bridge and  $sol$  to the electrolyte solution. Measurements with frequencies up to 200 Mc/sec yielded a stepwise course of the curve electroconductivity versus concentration for  $KCl$ ,  $MgCl_2$ , and  $AlCl_3$ . This is explained by steric hindrance effects on reformation of the hydrate complexes with a certain lifetime. Shortlived hydrates are found at

Card 1/2

Study of solutions by high...

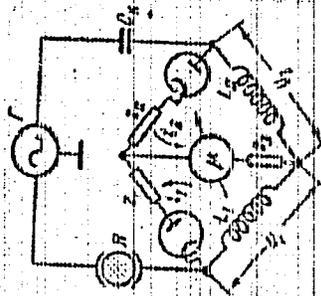

S/076/63/037/003/004/020

TITLE:

Concerning the Content of Radioactive Elements Found in waters of Oil Field Deposits (K voprosu o sodержanii radioelementov v vodakh neftyanykh mestorozhdeniy)

PERIODICAL:

Geokhimiya, 1958, Nr 7, pp 642-649 (USSR)

ABSTRACT:

The content of radium and uranium found in waters of oil field deposits was examined: radium was determined radio-chemically (Ref 3); the content of radon was measured by means of the electrometer ~~CG-12~~, the amount of uranium ascertained by luminescence. The research was conducted at the Laboratoriya yadernoy geofiziki i geologii Instituta nefti AN SSSR (Laboratory for Nuclear Geophysics of the Petroleum Institute AS USSR). Waters from wells as well as surface water from oil fields of West Turkmenia (Tables 1-3) were examined. Samples were taken from the petrol and mineral gas province of Emba (Kazakhstan) (Tables 4,5) and from oil fields in the Cis-Uralian region (Tables 6-8). Independent of the type of deposit, the radium content ranges from  $10^{-10}$  g/l, seldom under  $10^{-11}$  g/l. The uranium content seldom surmounts  $1.0 \cdot 10^{-7}$  g/l.

SOV/7-58-7-403

Concerning the Content of Radioactive Elements Found in Waters of Oil Field Deposits

The largest quantities of radium are to be found in waters of the calcium chloride type. Uranium is concentrated in waters of the sodium bicarbonate type. Radium is found in largest amounts in the marginal zones of the oil field deposits. There are 8 tables and 12 references, 11 of which are Soviet.

ISSUE 1 BOOK REVISIONS sov/600

Todorova, G. (1958) about study of isotopes, radioactivity isomobility and ionization of isotopes (Russian). Collection of Articles on the Use of Radioactive Isotopes and Neutrons in Petroleum Geology. Moscow, Geotekhnicheskii, 1958. 370 p. Article this inserted. 4,000 copies printed.

M. I. F. A. Alabegov, Professor, Director of Geological and Mineralogical Sciences; Moscow, M. I. F. A. Alabegov, Tech. M. I. A. S. Kholodina. **Purpose:** This book is intended for petroleum geologists, geophysicists and scientists engaged in geological research who are interested in radioisotopic methods of petroleum prospecting.

**Content:** The collection contains 28 articles compiled by staff members and assistants of the Laboratory for Nuclear Geology and Geophysics of the Institute of Geology and Mineralogy of the USSR Academy of Sciences (now the Institute of Geology and Mineralogy of the USSR Academy of Sciences USSR, the Laboratory for Nuclear Geology and Mineralogy of the USSR Academy of Sciences). The articles describe the methods of geophysical research for petroleum prospecting. The articles treat: new material on radioisotopic surveying in petroleum geology, describe radioisotopic instruments (counters, etc.) for registering neutrons and gamma rays, give the results of research with mobile radioisotopic stations, introduce methods of a new method for effectively utilizing radioactivity in the analysis of rock samples from petroleum-bearing basins, etc. Problems of radioisotopic surveying are treated, as well as the results of studies in the absorption of neutrons and the amount of petroleum and water in a stratum. The methods of surveying based on measuring the radioactivity of the surface of a prospective petroleum deposit is described. In particular, the methods are mentioned. References accompany each article.

TITLE: A device for thermostating specimens in NMR experiments.

SOURCE: Zhurnal fizicheskoy khimii, V.38, no.4, 1964, 1030-1031

TOPIC TAGS: thermoregulator, nuclear magnetic resonance, control circuit, temperature control, gas heat exchanger, spin echo

ABSTRACT: The article describes a device, which uses gaseous heat exchangers, for thermostating specimens in experiments with spin echo. The temperature of the investigated solutions was maintained at 40 to -300 as desired. Nitrogen gas was used as a heat exchanger. Its flow was regulated by changing the current through the heater in a Dewar flask with liquid nitrogen. To minimize the consumption of nitrogen and to achieve lower temperatures, the measuring head with the specimen was separated from the poles of the electromagnet by an air gap. In addition, the poles of the electromagnet are cooled by spiral tubes, placed around the poles, through which water

TITLE: Some relations characterizing the beam path in a cesium frequency standard

SOURCE: Izmeritel'naya tekhnika, no. 12, 1966, 51-53

TOPIC TAGS: frequency standard, cesium, frequency <sup>central</sup> standard, atomic clock

ABSTRACT: Early authors' experiments with the cesium atomic-beam frequency standard involved a collimating diaphragm and were found to be unwieldy. Hence, further experiments were conducted without collimators, their functions being performed by beam slits cut in the resonators. Formulas are deduced which impose certain conditions on the widths of the slits in the resonators, source, and detector and also on the field gradient of the deflecting magnets. These conditions make possible successful operation of the frequency standard not equipped with the collimating diaphragm and having symmetrical beam deflection. These relations are derived: detector slit width

$$b_n + \frac{l_0}{l_1 + l_2 + l_3 + l_4} b_p < \frac{4M_0 \gamma B}{3m \alpha^2} l_2 \left( \frac{l_1}{2} + l_1 \right)$$

$$b_0 = 2b_n + b_n.$$

$$b_p < \left[ \frac{4M_0 \gamma B}{3m \alpha^2} l_2 \left( \frac{l_1}{2} + l_1 \right) - b_n \right] \frac{l_1 + l_2 + l_3 + l_4}{l_0}$$

Card 1/2

UDC 621.373.083.76:546.36

ACC NR: AP7002707

The beam can be limited either by the first (from the source) or by the second resonator. If  $b_n + b_p < \frac{a l_1}{v^2} (2l_1 + l_2)$ , the first resonator places the limitation; if  $b_n + b_p > \frac{a l_1}{v^2} (2l_1 + l_2)$ , the second. Here,  $b_n$  - source slit width and  $b_p$  - resonator slit width. Actually, both resonator slits act simultaneously as the beam contains atoms that have different speeds. Orig. art. has: 2 figures and 24 formulas.

**TITLE:** Thermal-mechanical treatment of steel to give high strength

**PERIODICAL:** Metallovedeniye i termicheskaya obrabotka metallov,  
1961, No.5, pp. 2-9

**TEXT:** The authors point out that recently such attention has been given to combined mechanical and heat treatment, by two possible methods. In one method the steel is rapidly deformed in the austenite-stable temperature range and quenched. While this improves the steel in many ways it fails to increase tensile strength. In the second method the steel is deformed at a temperature between the martensite point  $M_d$  and the recrystallization temperature, and quenched. This gives increased strength with satisfactory plasticity. Results of thermal-mechanical

E111/E152

Thermal-mechanical treatment of steel to give high strength treatment are not universally successful, and there are no reliable data on the practical use of the "ausform" or "ausforming" treatment widely advertised in the USA. The object of the present work was the study of thermal-mechanical treatment of alloy structural steels to a high strength and the structure produced by the treatment. The composition of the steels was as shown in Table 1, steels A-Γ being melted in induction and Δ and E in arc furnaces: the first group were austenitized at 1000, the second at 900 °C. After cooling in a nitrate bath to the deformation temperature the steels were rolled in 4-5 passes (reduction 90%), oil-quenched and tempered. To reduce cooling the work was reheated between passes and other measures taken, e.g. rolls were preheated to 100 °C. A portable magnetic instrument (developed by G.Yu. Sila-Novitskiy and T.D. Kutyskhina) was used to detect isothermal-decomposition products; if found, the specimen was rejected. After treatment specimens had a hardness Rc of 58-64 and mechanical-test pieces were prepared by spark machining and removal by grinding (temperature kept below 100 °C)

Card 2/8

S/129/61/000/005/001/003  
E111/E152

Thermal-mechanical treatment of steel to give high strength of a 0.5 mm deep surface layer. Fig.2 shows tensile strength kg/mm<sup>2</sup> and relative elongation as functions of carbon content for steels A, B, A and E after treatment (90% deformation at 550 °C, 4 hours tempering at 100 °C); for steel A tempering at 100 and 200 °C is shown by points 1 and 2 respectively, steels E and A indicated by point 3. Fig.3 shows for steel A tensile strength and elongation in relation to the 90% deformation temperature (tempering at 100 °C). The effect of variation in austenitization temperature with 90% deformation and tempering at 100 °C of steel A on tensile strength, Rockwell hardness and elongation is shown in Fig.4. Fig.5 shows the effect of tempering temperature on these properties of the normally thermomechanically treated alloys B and A (left- and right-hand graphs respectively). The treatment enabled a tensile strength of 280-300 kg/mm<sup>2</sup> and elongation of 6% to be obtained for the steels tested, which is better than with ordinary or stepwise hardening followed by low-temperature tempering. As carbon content rises to about 0.5% strength of thermomechanically treated steels rises, and falls with higher

Card 3/8, 5

X

22545  
S/129/61/000/005/001/003  
E111/E152

Thermal-mechanical treatment of steel to give high strength  
C content due to semi-brittle or brittle fracture. The best  
strength/plasticity combination was obtained with tempering at  
100 °C. In some experiments on steel 6 the deformation was  
decreased to 50%; the results were less favourable than with the  
90% deformation as regards strength, but gave high plasticity.  
The advantage of 50% deformation is that it can be effected at  
relatively high temperatures, even above the recrystallization  
temperature. Bend tests on 60 x 10 x 2 mm plates of steel 6  
heated in various ways were also carried out. Electron-  
microscopic study of the fine structure of thermomechanically  
treated steel A showed a pronounced texture and considerable  
refinement of martensite plates. X-ray diffraction by rotating  
specimens was also studied (with a JPC-50W (URS-50I) ionization  
apparatus with automatic recording of intensity distribution in  
 $F_{\alpha_1}$  radiation); block size of the thermomechanically treated  
steel was one half to one quarter that obtained with ordinary  
hardening. The authors conclude that structure refinement is one  
factor in the effectiveness of the treatment.

and 12 and 13, steel 4 remelted in a consumable-electrode vacuum arc furnace. The ausforming consisted of austenitizing at 1000°C, gas-peter bath or furnace cooling to 500°C, rolling in 5 to 7 passes with a total reduction of 90%, and oil quenching. This was followed by tempering at 100, 200, 300, or 400°C for 3 hrs. The specimens were encased in X18CrNiTi stainless steel envelopes; rolls were preheated to 80-100°C. In all steels the best combination of strength and ductility -- tensile strength  $\sigma_b$  of 280-290 kg/mm<sup>2</sup> and elongation of  $\delta = 6$  to 9% -- was obtained by tempering at 100°C. Remelted steels generally were found to have higher strength and ductility. After tempering at 100°C the induction-melted steels had a yield strength  $\sigma_{0.2}$  of 200.5 kg/mm<sup>2</sup>,  $\sigma_b = 266.5$  kg/mm<sup>2</sup>,  $\delta = 8.6\%$ . In remelted steels (except for steels vacuum-remelted in a magnetic field,  $\sigma_b$  varied from 280 to 290 kg/mm<sup>2</sup>,  $\sigma_{0.2}$  from 180 to 210 kg/mm<sup>2</sup>, and  $\delta$  from 6 to 10%. Steels conventionally hardened and tempered at 100°C in many cases showed partial brittle failure. Short-time

3031. (879) INTRA-AORTIC BLOOD TRANSFUSION (Russian text) - Yermakov  
V. S. - KHIRURGIYA 1958<sup>3</sup>, 11 (23-27) illus. 1

A series of cases is presented in which transfusions into the abdominal aorta were employed. The method was used in grave surgical shock and in blood loss. A good and stable effect was seen in 7 out of 14 patients who recovered. An effect of short duration was obtained in 2 patients. The observations show that the intra-aortic transfusion is a powerful therapeutic measure which may be employed in prophylaxis and in combating severe shock. The rise of arterial blood pressure, improvement of the cardiac activity and respiration appeared directly after the injection of the first portions of the blood. The total amount of blood injected in shock was 70-140 ml., while in shock combined with blood loss it was 250-300 ml. A special method for the intra-aortic blood transfusion, which enables to control the aortic blood pressure and, consequently, to determine the required amount of blood for the achievement of the effect is suggested.
