Title : Some boundary problems for parabolic systems in the semispace

Periodical : Dok. AN SSSR 106/1, 11-14, Jan 1, 1956

Abstract : A solution is sought of some boundary problems expressed by differential equations of the parabolic type, such as, $\frac{\partial u}{\partial \nu} = \left(\frac{\partial^2 u}{\partial z^2} \right)_{z=0}$.

Firstly, the author specifies the parabolic system which is standard and sufficient for the solution of the problem. Then he proves the existence of a solution.

TITLE: Some Mixed Problems for Parabolic Systems of Differential Equations (Nekotoryye smeshannyye zadachi dlya parabolicheskikh sistem differentsial'nykh uravneniy)

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 117, Nr. 3, pp. 359-362 (USSR)

ABSTRACT: In the domain γ bounded by the convex surface S of the type of Lyapunov, determine that solution of

$$(1) \quad \frac{\partial u}{\partial t} = A(\frac{\partial}{\partial x})u$$

which satisfies the conditions 1. $t=0, u=0$, 2. $\lim_{x \rightarrow y \in S} B_1(\frac{\partial}{\partial x})u = f_1(y, t)$. Here we have

$$A(\frac{\partial}{\partial x}) = \left\| \sum_{k_1+...+k_n=s}^{(k_1, \dots, k_n)} a_{ij}^s \frac{\partial^s}{\partial x_1 \dots \partial x_n} \right\|$$

$$B_1(\frac{\partial}{\partial x}) = \left\| \sum_{k_1+...+k_n=s_1}^{(k_1, \dots, k_n)} b_{rl}^s \frac{\partial^s}{\partial x_1 \dots \partial x_n} \right\|$$

Card 1/3

Some Mixed Problems for Parabolic Systems of Differential Equations 20-3-1/52

$(i=1, 2, \dots, N; j=1, 2, \dots, N; r=1, 2, \dots, \frac{N}{2}; l=1, 2, \dots, N).$

a_{ij} and b_{rl} are constants, s positive even, s_1 positive integral, $s_1 < s$, $x = (x_1, \dots, x_n)$, $u = (u_1, \dots, u_N)$, $f(y, t) = [f_1(y, t), \dots, f_{\frac{sN}{2}}(y, t)]$ - continuous in every point $y \in S$ for $t > 0$, $|f_j(y, t)| < ce^{-\delta t}$, $c > 0$, $\delta > 0$.

Starting from his earlier results (Ref. 3) the author seeks the solution in the form

$$(2) \quad u = \frac{1}{(2\pi)^{\frac{n-1}{2}}} \int_0^t d\tau \int_S g_y^y(x-y; t-\tau) \varphi(y, \tau) dy S,$$

where g_y^y is the normak of the surface in $y \in S$ and g is a certain Green's function. (2) satisfies (1) and the first condition; in order that also the second condition is satisfied,

Card 2/3

Some Mixed Problems for Parabolic Systems of Differential Equations 20-3-1/52

φ has to be chosen correspondingly. φ is chosen with the aid of the lemma:

$$\lim_{x \rightarrow z \in S} B_1 \left(\frac{\partial}{\partial x} \right) u(x, t) = B_1 \left(\frac{\partial}{\partial x} \right) u(x, t) \Big|_{x=z} + \varphi(z, t).$$

For the determination of $\varphi(z, t)$ one obtains the integral equation

$$(s, t) + \frac{1}{(2\pi)^{\frac{n-1}{2}}} \int_0^t d\tau \int_S B_1 \left(\frac{\partial}{\partial x} \right) a^y (x-y; t-\tau) \Big|_{x=s} \varphi(y, \tau) dy = f(s, t)$$

which is solved by the author by successive approximation with the initial value $\varphi_0(z, t) = f(z, t)$.

TITLE:

Certain Boundary Problems for a System of Differential Equations of the Parabolic Type with Variable Coefficients (Nekotoryye granichnyye zadachi dlya sistemy differentsial'nykh uravneniy parabolicheskogo tipa s izmenyayushchimisya koeffitsiyentami)

PERIODICAL:

Dopovidi Akademii nauk Ukrains'koi RSR, 1953, Nr 4,
pp 364-367 (USSR)

ABSTRACT:

The author considers a system of differential equations of the parabolic type with variable coefficients depending on x and t : $\frac{\partial u}{\partial t} - A_s(x, t, D)u - A_{s-1}(x, t, D)u - \dots - A_0(x, t, D)u = 0$

which has to satisfy certain initial and boundary conditions. Making use of the methods of Ya.B. Lopatinskiy [Ref. 1] and S.D. Eydelen [Ref. 2] the author looks for a solution of this system, i.e., for a vector function $u = (u_1, \dots, u_N)$ of the height N , in the form:

$$u = \int dt \int_S G(x-y; t-\tau) \varphi(y, \tau) dy S$$

where G is Green's function, and $\varphi(y, \tau)$ is an unknown continuous vector function of the height $s \frac{N}{2}$ (s is a

Card 1/2

positive even integer), and S is a convex surface of

SOV-21-58-4-2/29
Certain Boundary Problems for a System of Differential Equations of the
Parabolic Type with Variable Coefficients

Lyapunov's type. Based on his previous publications [Ref 3,4 and 5], the author reduces the problem of finding the unknown function φ , which would satisfy the given initial and boundary conditions, to a certain integral equation. The solvability of the obtained kind of equation was proved by the author in Ref. 4. There are 5 Soviet references.

ABSTRACT: To increase the output power of a frequency converter using direct-coupled transistors, the following recommendations are made: a) operate the converter with singular input-to-output frequency ratios to assure a uniform transistor loading with average current; b) to reduce switching losses and losses during operation in transistors, a compound transistor circuit should be used in series with a semiconductor diode, and to reduce losses in the second transistor due to deep saturation, a resistor should be used in its collector circuit, and c) use pulsed transistor overloading to preserve their nominal average loading. TITLE: Certain problems of automation of thermal power generator control

SOURCE: AN SSSR. Sibirskoye otdeleniya. Izvestiya. Seriya tehnicheskikh nauc,
no. 2, 1965, 27-35

TOPIC TAGS: power plant, gas turbine engine, automatic control design, automation equipment

ABSTRACT: With the increase in the power of individual power-producing units, the problem of control of thermal power generators became considerably more complex. The situation will become especially critical with the development of combined gas-turbine devices which are presently in the design stage (see, for example, the monograph by I. A. Ratanovskiy i dr. kly ("Combined Gas-Turbine Devices and Cycles"), Gosenergoprodat, 1962). The usual approaches to automatic control design cannot be used here because the characteristics of the generating object and the relationship between its parameters during the start and stop of operation are quite unknown. Consequently, the automation of the control of such new objects must be established on the basis of generalized data concerning the existing thermal generator devices and

UDC: 621.4-546:621.4-544

Card 1/2

L 29120-66

ACC NR: AP6018863

those under construction, taking care, at the same time, of the possible deviations of the parameters of real equipment from their generalized values. Consequently, the authors give a detailed generalized analysis of the underlying premises and peculiarities of automation of the process of starting and stopping of the above-mentioned devices. A control system is proposed for starting (and stopping) the operation of thermal power generator objects with a speed which is not less than 10% of the rated value.

TOPIC TAGS: frequency converter, static frequency converter, transistorized commutator converter, bridged transistorized commutator, transistorized commutator

ABSTRACT: The patent describes a static frequency converter based on a reverse amplifier with two magnetic amplifiers and a transistorized commutator. For reducing size and weight and improving efficiency, the commutator is made with four transistors connected in a bridge arrangement with a load on its diagonal, while the two free sides of the bridge are connected to the output terminals of each of the magnetic amplifiers. (see Enclosure 01).

TITLE: Controlled frequency converters using high-power elements with a key characteristic

SOURCE: Ref. zh. Avtomat. telemekh. i vychisl. tekhn., Abs. 1A130

REF SOURCE: Mezhvuz. sb. tr. Zap.-Sib. sovet po koordinatsii i planir. nauchno-issled. rabot po tekhn. i yestestv. naukam, vyp. 4, 1965, 110-115

TOPIC TAGS: frequency converter, thyristor, transistor

ABSTRACT: Controlled frequency converters (CFC) using high-power elements with a key characteristic (transistors or thyristors) are investigated. The CFC circuits in question have no intermediate a. c. to d. c. conversion for further inversion. The power section of the CFC is designed as a reversible bridge circuit (3 single-phase CFC using bridge circuits). The circuit operation is

UDC: 62-52:621. 314. 26

Card 1/2

L 47096-66
ACC NR: AR6016015

O

described. The use of this circuit permits exclusion of short-circuit currents, in the CFC groups and virtually currentless switching between the groups; it is possible therefore to avoid the use of reactors. Switching losses equal about one half as numerous as in CFCs using intermediate conversion (rectification). The absence of reactive elements in the power circuit makes it theoretically possible to obtain an unlimited range of frequency variations. SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya tekhnicheskikh nauk, no. 2, 1965, 49-53

TOPIC TAGS: electronic amplifier, amplifier design, solid state amplifier, audio amplifier

ABSTRACT: A comparative analysis was made of two multistage amplifiers consisting of k stages, each with gain A . The first was provided with negative feedback B for each individual stage and overall positive feedback. The second had only overall negative feedback. The results showed that the relative accuracy of the first amplifier was higher than that of the second by a factor of $1/(1 - AB)^{k-1}$. A high-accuracy amplifier of the first type was constructed (see Fig. 1 of enclosure). It consists of two amplifier stages separated by an emitter follower for impedance matching. The measurement error of the amplifier does not exceed 0.3% in an ambient temperature range of -50 to 65°C, even when the gain instabilities of individual

TITLE: Measurement of high-frequency fields in a plasma waveguide

SOURCE: Zhurnal tekhnicheskoy fiziki, v.34, no.3, 1964, 469-473

TOPIC TAGS: plasma, plasma waveguide, field distribution, field strength, field distribution measurement, field strength measurement, electric probe, electron beam field measurement

ABSTRACT: The longitudinal component of the high frequency electric field in a plasma waveguide was measured. The mercury vapor plasma was contained in a 7-cm diameter glass tube and was excited at 120 Mc by an external electrode at one end. The measurements were performed over a range of plasma densities yielding phase velocities from slightly greater than 0.7c to slightly less than 0.1c. No external magnetic field was applied. The radial distribution of the longitudinal electric field was determined with an electric probe that was movable radially within the plasma. Standing waves were produced by a reflector, and the probe was moved in a plane of maximum electric field. The field amplitude was found to reach a maximum at a radius

Card 1/3

ACC.NR. AP4020575

somewhat less than that of the tube. This is presumably due to a decrease in the electron density, and hence in the Langmuir frequency, as the wall of the tube is approached. The measurements were otherwise in good agreement with simple theoretical expectations, and it is concluded that the plasma density within the plasma waveguide can be determined by measurements of the electric field strength distribution outside it. The absolute value of the longitudinal electric field was determined by the deflection of a beam of electrons traversing the waveguide in a direction perpendicular to its axis. The measurements were performed with traveling waves in the waveguide, a suitable load being employed to prevent standing wave formation. Electrons of 10-keV energy were used; these traversed the waveguide in about one-tenth of a wave period. The electron beam deflection was calibrated at low frequency with the aid of a parallel plate capacitor, the distribution of the field between the plates of which approximated that of the field in the waveguide. The results of the measurements were expressed in terms of an equivalent shunt resistance and are presented graphically as a curve showing the equivalent resistance as a function of the phase velocity. *Abstracter's note:* The authors state that the equivalent shunt resistance approaches zero as the phase velocity increases, but their curve does not substan-

2/3
Card

ACC.NR: AP4020575

tiate this, and it seems doubtful. The authors also state that the equivalent shunt resistance is considerably smaller than the theoretical value at the lower phase velocities, and they account for this as a result of collision frequencies comparable with (although smaller than) the wave frequency. "In conclusion, we consider it our pleasant duty to express our gratitude to Ya.B.Kaynberg for his interest in the work and for valuable suggestions." Orig.art.has: 7 formulas and 5 figures.

TITLE: Design of a Phase-sensitive Circuit with Variconds

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,
Elektromekhanika, 1959, Nr 8, pp 79-85 (USSR)

ABSTRACT: Variconds are capacitors with siegnette-ceramic dielectric. In the circuit of Fig 1, which works on the principle of adding and subtracting pulses, type VK1-B devices are used. The load resistance r_H is assumed to be much less than the reactance of either capacitor. The effective value of the load current, as a function of the phase shift between the capacitor currents is Eq (4). The instantaneous values of the currents may be found using the approximate relation between charge and voltage as suggested in Ref 1. The coefficients α and β in this relation (Eq (5)) are given in Table 1 for three types of varicond. The separate expressions for capacitor current are Eqs (8) and (9) and the square of the load current is Eq (11). The three terms of this equation, which must be integrated, are processed in different ways. The first suffers a change of variable $y = \tan z$ and is then

Card 1/3

SOV/144-59-8-8/14

Design of a Phase-sensitive Circuit with Varicords

treated as a rational function, Eq (14). The second is evaluated by the approximation given in Ref 2. The third is treated like the first, Eq (15). The final expression for load current is Eq (16). Charge-Voltage curves for several types of capacitor are given in Fig 2, while Fig 3 compares calculated (curve 1) and measured (curve 2) values of capacitor current versus phase angle. Table 2 gives values of the function $N_1(\delta)$ which appears in Eq (16). The phase-detection characteristics for VKL-5 units at various voltages are in Fig 4, the discrepancy between theory and experiment being about 4%. Analogous results for VKL-2 and VKL-3 units are summarized in Table 3, where the errors are 5-7%. The detection characteristics depend on the peak currents in the capacitors and differ from the sinusoidal curves described in Ref 3 for linear capacitors.

TITLE: Profuse Tillering of Winter Wheat (Moshchnoye ku-shcheniye ozimoy pshenitsy)

PERIODICAL: Priroda, 1959, Nr 2, p.111 (USSR)

ABSTRACT: The authors describe the phenomenon of a profuse growing of side-shoots from low-lying buds in young crops of winter wheat observed in autumn 1957 in the Cherkasskaya gosudarstvennaya sel'skokhozyaystvennaya opytnaya stantsiya (Cherkasskaya State Agricultural Experimental Station). The authors explain this phenomenon by the especially favorable interplay of cultivation method and weather conditions. The seed had been sown into bare fallow enriched with 25 tons of manure and mineral fertilizer. The sowing day of 5 September 1957 represented the best possible date in this region. The month of September 1957 had a precipitation of 34.4 mm which is nearly twice the

PERIODICAL: Tr. Dagestansk. s.-kh. in-ta, 1956, Vol 9, pp 3-8

ABSTRACT: This paper describes experimental studies on the
effect of fertilizers on the potato crop in the
climate and soils on the plains of Dagestan. The
Dagestan Agricultural Institute conducted experimental
studies in crop rotation. This study presents tables
showing crops of potato varieties Mozhestik and Lorkh,
and includes a bibliography of seven titles.

Title : Manure as a Plant Nutritive in Irrigation.

Orig Pub: Tr. Dagestansk. s.-kh. in-ta, 1956, 9, 30-35.

Abstract: Both passing irrigation water through natural troughs filled with manure and using trench sprinklers require excessive labor input and result in uneven distribution of the nutritive elements on the field. It is proposed that a hole with a volume of up to 3 cubic meters be dug not far from the irrigating ditches and that in this hole one ton of manure be mixed with one cubic meter of water. Then the irrigation waters can be passed through this mixture. When manure was used in a dose of 4-5 T/hectare, a grain harvest of 18.4 centners/hectare was

Title : Anatomic Peculiarities of the Pericardium on X-Rays.

Orig Pub : Vracheb. delo, 1957, No 1, 45-48.

Abstract : A study was made on 7 cadavers that were newborn and 9 embryos from 6 to 8 months of age. From 0.5 to 3 ml. of uroselectan were injected into the pericardial sac. In 6 cases the pericardium reduplicated the shape of the heart without revealing the cardio-diaphragmatic sinuses. In 10 cases these sinuses were large and became apparent as additional triangular shadows which were larger on the left. A study of 1100 people, ranging from 6 months to 70 years of age, revealed that in 89.1% of cases the pericardium reduplicated the shape of the heart chambers. In the remaining 120 people

(10.9%) homogeneous dark areas, triangular in shape, with sharp external contours (rectilinear, concave and, more rarely, convex) were observed. The intensity of the indicated dark area was less than that of the heart; during inspiration transmitted pulsations were revealed. Multiaxial studies as well as the studies during the various phases of respiration permitted differentiation between the heart shadow and that of pericardial fatty deposits, reduplication of the mediastinal pleura, inferior vena cava, etc.

Hardness of metallic bodies under strain. D. M.
Zagorevskiy. Vuz Metallurgii, 1961, No. 10, p. 12.
Change of hardness during deformation inside the elastic limit was investigated in samples
of C-steel analyzing 0.29 C, 0.12 Si, 0.50 Mn, 0.04 P and
0.02 S, and of Cr-steel analyzing 0.92 C, 0.24 Si, 0.01
Mn, 0.04 P, 0.01 S and 1.2 Cr and of Al. In all tests
a decrease in hardness was observed (in some cases up to
18% of the initial value). This decrease reaches a maxi-
mum at the elastic limit.
S. L. Madorsky

AB-1A METALLURGICAL LITERATURE CLASSIFICATION

Quenching after Hot Deformation. D. M. Zagorodnikh (Vestnik Metalloproizvodstva, 1939, No. 6, pp. 71-79). (In Russian). The experiments to investigate the effect of hot deformation prior to quenching were carried out on spring steel of the following composition: Carbon 0.34%, silicon 0.54%, manganese 1.31%, sulphur 0.08%, and phosphorus 0.07%. In the experiments two test pieces were simultaneously heated to temperatures of 870-1070°C. One of the test pieces was then forged down some 60% by a single blow (without change in temperature), and both were then quenched together in water at 18°C. It was found that the average hardness of all deformed test pieces was less than that of the unforged ones. The microstructure of quenched forged test pieces consisted of finer acicular martensite than that of undeformed specimens. In addition, the former showed troostite inclusions. There was no difference in the Debye X-ray diagrams.

HARDNESS IN THE STRESSED STATE. D. M. Zagorodskikh. (Vestnik Metallopromyshlennosti, 1939, No. 10-11, pp 54-59). (In Russian).
The author investigated the hardness of steel under different conditions of stress. To do this he carried out Shore and Rockwell hardness tests on normalised specimens of two mild steels while they were being subjected to torsion tests. It was found that under torsional stress the hardness values as measured by the Rockwell and Shore methods did not change in the same manner, the former remaining unchanged in the range of elastic deformation. At the yield point there was a drop in the Rockwell hardness of 7-17%. In one of the steels there was an increase in the Rockwell hardness after the yield point had been passed, whilst the other specimen did not show this. The Rockwell hardness of all the test-pieces was increased by fracturing. The Shore hardness increased at the yield point and increased continuously in the elastic deformation range. In bend tests the hardness remained unchanged, whilst in the elastic range a progressive drop in hardness set in with plastic deformation.

Device for Adjustment of Specimens During Impact Testing and Results of Test on Displaced Notches. (In Russian.) D. M. Zagorodnikh. Factory Laboratory (U.S.S.R.), v. 18, Apr. 1947, p. 503-505.

Describes simple jig for the above and charts, tabulates, and illustrates results of notch tests on 2 steels with the notches displaced various small distances from the proper location.

Viscous, brittle, and boundary cracks in impact tests.
D. M. Zagorodskikh. *Zhur. Tekh. Fiz.* (J. Tech. Phys.)
17, 180-91 (1947).—Steel samples with 5-mm. semicircular
notches show 3 types of cracks, viscous and brittle.
The former are relatively superficial, penetrating no deeper
than 1 mm., and are seen to turn around the grains and
their fragments. Brittle cracks only appear in samples
with a sharp notch. These pass mostly through the grains,
occasionally changing their direction by 90°, continue
towards inclusions of MnS, and end within a ferrite grain.
A 3rd type of crack runs along the boundary between de-
formed and undeformed parts, following grains of in-
cluded MnS. N. Tch.
