PROCESSIONAL PROPERTIES 0004

Important losses of nitrogen in decay and humification of red clays. J. M. H. Krasz and Krasnowicz. Proc. Soil Intern. Congr., Soil Sci., Belgrade, 1960, IV, 238-242 (1962) (in German). Expts. on the humification of red clays under uncontrolled conditions show that while the residue progressively increases in percentage of total and albuminoid N, there is an abs. loss of N which may amount to 45% in 2 weeks. This loss is believed to occur as free N, since nitrate and nitrite formation could not be demonstrated, and there was no loss to PbO. The C:N ratio in the final product of humification is nearly the same as that in humus prep. from soils. Humification of plant residues is not to be considered solely biol.; physico-chem. processes also play a part.

"Bilateral Fracture of the Femoral Neck and Unilateral Pectrochanteric Fracture in a Patient with Parkinson's Disease."

Budapest, Magyar Traumatologia, Orthopaedia es Helyreallito Sebeszet, Vol IX, No 3, Jul 66, pages 181-185.

Abstract: [Authors' English summary modified] Fracture of the femoral neck on the left, 4 years later the same injury on the right and, after another year, a pectrochanteric fracture on the left was sustained by a 57 year old woman patient with Parkinson's disease. On the basis of the clinical features, the radiological examination and venographic studies, the transient importance of the vessel of the ligamentum teres is pointed out, on one hand, and new data are presented to verify the identical tendencies of healing in the case of bilateral fractures of the femoral neck, on the other hand. Finally, on the basis of the course of recovery of the fractures, nailing of the femoral neck is recommended in the case of Parkinson's disease as well. It is considered to be important, however, that the intervention be accompanied by a primary Voss' operation.

5. The effect of ions on the density of water in an aqueous solution of electrolytes -- Az ionic field a leg vizsgalatosságának hatásai -- S. Lengyel, E. Pálfi and M. Ádám (Hungarian Journal of Chemistry) - Magyar Kémiai Folyóirat - Vol. 51, 1952 No. 11, pp 138-150, 15 figs, 14 tabs.)

The fact that ions increase the density of water in their environment can be inferred from the changes in volume occurring when dissolving electrolytes in water. A 1 to 1% increase in the density of water may be observed at a distance of 3 to 4 Å from the centre of the ion. Changes in the density of the water surrounding the ion can be established as a function of the distance measured from the centre of the ion. The validity of the mathematical correlation obtained in this manner was investigated for I^- , Na^+ , K^+ , Rb^+ , Cs^+ , Li^+ , F^- , Cl^- , Br^- and I^- ions. It was proven that the water density increasing effect of the positive ions increased in proportion to the increase in valence. The effect of the alkali metal ions is roughly the same. The effect of sodium and potassium ions is considerable up to the limit of a 5 to 6 Å radius sphere and can even be observed at a radius of 20 Å, while the effect is somewhat less in the case of lithium. In the event of negative ions no equivalent correlations could be found between the radius of the ions and the density of water. It could be established however in a general sense, that the effect decreased in proportion to the increase of the radius of the ion.

TEXT: A simplified method of preparing cell electrodes is patented. Alloy sheets cut to size are assembled in a cell. 80 g of zinc powder containing 99.8% Zn is charged into a corundum crucible. 20 g of silver powder with $\geq 99.5\%$ Ag are then added to decrease the evaporation loss. After this, the crucible is heated in an argon or nitrogen atmosphere until the metal is melted. It is mixed with a corundum stirrer. The cooled alloy is rolled to the required thickness with periodic heating to prevent formation of cracks. The positive electrode made in this way contains 3 - 34% Zn and the negative 3 - 37% Ag. During formation, the Zn in the positive electrode is dissolved and the Ag remaining has a spongy structure; the Ag in the negative electrode takes no part.

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 21, 1962, 337, abstract 21K253 (Hung. patent, 148251, September 30, 1961)

TEXT: Al_2O_3 insulators as used in radio engineering industry, e.g. for heated electron tube cathodes, occasionally suffer breakdowns at high temperatures on account of impurities in the Al_2O_3 . The authors found that small admixtures of Mo (0.1 - 2%) formed complexes with the impurities and improved the insulating qualities of the product. As the coloring becomes somewhat darker the heat radiating capacity of the surface is increased. Mo can be introduced either as a powder in the ordinary process of milling, or by covering it on the grains of the ceramic mass or on the surface of the shaped articles by evaporating a Mo-containing compound in vacuo. Further treatment of the articles follows the usual course. During baking, Mo diffuses into the surface layer of the articles and creates a well insulating film. The Application of Polyharmonic Polynomials for the Solution of Boundary Value Problems for the Polyharmonic Equation

The f_i and ψ_i are assumed to be continuous on Γ ; Γ consists of finitely many piecewise smooth arcs and bounds a simply connected region Ω ; ν is the direction of the exterior normal of Γ . The approximate solutions are sought in the form

$$(4) \quad u_{pn} = \sum_{i=0}^{p-1} \sum_{j=0}^n q^{i+2j} (a_{ij} \cos i\theta + b_{ij} \sin i\theta)$$

where q, θ are polar coordinates of the point, and a_{ij}, b_{ij} are constants.

At first it is proved that the boundary conditions (2) can be replaced by the equivalent conditions

Card 2/7

The Application of Polyharmonic Polynomials for the Solution of Boundary Value Problems for the Polyharmonic Equation

where $\psi_j(s)$ are certain functions which can be explained by the $f_i(s)$, and $[A]$ means the largest integer contained in A . Then the metric is chosen in which the strong solution of (1)-(2') shall be approximated by (4). The set of all regular (cf. (Ref. 2)) polyharmonic functions defined on Ω becomes a Hilbert space by introducing the scalar product

$$(5) \quad (u, v) = \sum_{k=0}^{\left[\frac{p-1}{2}\right]} \int \left(\Delta^k u \Delta^k v + \frac{\partial \Delta^k u}{\partial s} - \frac{\partial \Delta^k v}{\partial s} \right) ds$$

where the prime means that for an odd p the last summand is missing, and the norm

$$(6) \quad \|u\|^2 = \sum_{k=0}^{\left[\frac{p-1}{2}\right]} \int \left[(\Delta^k u)^2 + \left(\frac{\partial \Delta^k u}{\partial s} \right)^2 \right] ds$$

Card 4/7

88180

S/140/60/000/006/006/018
C111/C222

The Application of Polyharmonic Polynomials for the Solution of Boundary Value Problems for the Polyharmonic Equation

The distance between the elements u and v is the norm of its difference:

$$(9) \quad \varsigma^2(u, v) = \|u - v\|^2 = \sum_{k=0}^{\left[\frac{p-1}{2}\right]} \int \left[(\Delta^k u - \Delta^k v)^2 + \left(\frac{\partial \Delta^k u}{\partial s} - \frac{\partial \Delta^k v}{\partial s} \right)^2 \right] ds.$$

Theorem 1 : The set of polyharmonic polynomials (4) is closed in the space H in the sense of the metric (9). A polyharmonic polynomial (4) of degree $n + 2(p-1)$ in x, y with the property that $\|U - u_{pn}\|^2 = \varsigma^2(U, u_{pn})$ becomes a minimum, where U is the strong solution, is chosen as an approximate solution of (1)-(2').

Let this polynomial be

$$(12) \quad Q_{pn} = \sum_{j=0}^{p-1} \sum_{i=0}^n \varsigma^{1+2j} (\alpha_{ij} \cos i\theta + \beta_{ij} \sin i\theta).$$

Then the $(2n+1)p$ parameter α_{ij} , β_{ij} must be found from the following
Card 5/7

88180

S/140/60/000/006/006/018

C111/C222

The Application of Polyharmonic Polynomials for the Solution of Boundary Value Problems for the Polyharmonic Equation

(2n + 1)p algebraic equations :

$$(13) \quad \begin{aligned} \frac{\partial \parallel u - u_{pn} \parallel^2}{\partial a_{ij}} &= 0 & \frac{\partial \parallel u - u_{pn} \parallel^2}{\partial b_{ij}} &= 0 \\ \left(\begin{array}{l} i = \overline{0, n}, \\ j = \overline{0, p-1} \end{array} \right), \quad & \left(\begin{array}{l} i = \overline{1, n}, \\ j = \overline{0, p-1} \end{array} \right). \end{aligned}$$

Theorem 2 : The algebraic system (13) has a unique solution, i.e. there exists a single polyharmonic polynomial (12) of degree $n + 2(p-1)$ which yields a best approximation in the sense of the above metric.

Theorem 3 : For $n \rightarrow \infty$, the best polynomial Q_{pn} converges uniformly to the strong solution of the considered problem in Ω .

The problem (1)-(3) is treated with the same scheme, but the scalar product is defined by (17), and the norm is defined by (19).

TITLE:

On the Approximative Solution of the Polyharmonic Problem
(O priblizhennom reshenii poligarmomicheskoy zadachi)

PERIODICAL: Doklady Akademii nauk, SSSR, 1958, Vol 122, Nr 6, pp 971-973 (USSR)

ABSTRACT: The author considers the boundary value problem

$$(1) \quad \Delta^p U = \sum_{\alpha, \beta=0, p}^{p!} \frac{p!}{\alpha! \beta!} \frac{\partial^{2p} U}{\partial x^\alpha \partial y^\beta} = 0$$

$\alpha + \beta = p$

$$(2) \quad U|_{\Gamma} = f_0(s), \quad \frac{\partial U}{\partial \nu}|_{\Gamma} = f_1(s), \dots, \quad \frac{\partial^{p-1} U}{\partial \nu^{p-1}}|_{\Gamma} = f_{p-1}(s)$$

where Γ is the piecewise smooth boundary of the domain Ω .
As approximating functions the author uses polyharmonic polynomials in polar coordinates

$$u_{pn} = \sum_{i=1, n} s^{2(i-1)+j} (a_{ij} \cos j\theta + b_{ij} \sin j\theta)$$

Card 1/2

On the Approximative Solution of the polyharmonic Problem Sov/70-122-6-4/49
The set of all regular [Ref 2] polyharmonic functions defined in Ω is made an Hilbert space by introducing the scalar product. The approximating polynomial is chosen so that in the metric of the Hilbert space $\|u - u_{pn}\|^2$ becomes a minimum. It is proved that for $n \rightarrow \infty$ the approximating sequence uniformly converges to the exact solution of the problem.

AUTHOR: Zolin, A.F.TITLE: A Method of Approximative Conformal MappingsPERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1960,
No. 4, pp. 101-105TEXT: The conformal mapping of a domain G on the unit circle is performed according to (Ref. 1) by

(1)
$$\Lambda(z) = (z-z_0)e^{\phi(z)},$$

where $z_0 \in G$ passes over into the center of the circle. Here $\phi(z)$ is an entire function analytic in G , $\operatorname{Re} \phi(z)|_{\Gamma} = -\ln r$, where Γ is the boundary of G and $r = |z-z_0|$.

The author approximates $\phi(z)$ by polynomials such that for $n \rightarrow \infty$ the modulus $|\phi(z) - P_n(z)| \rightarrow 0$ in all $z \in G$, and thereby he obtains a sequence of approximative conformal mappings of the domain G on the unit circle. The convergence of these approximative mappings to the rigorous mapping is proved. The approximation of $\phi(z)$ is carried out by separate approximation of $\operatorname{Re} \phi(z)$ and $\operatorname{Im} \phi(z)$ by harmonic polynomials. The proposed method

TITLE: The solution of boundary value problems for the Laplace equation with the interpolation method

PERIODICAL: Referativnyy zhurnal. Matematika, no. 7, 1961, 48, abstract 7 B 210. ("Issled. po matem. analizu i mekhanike v Uzbekistane". Tashkent, AN Uz SSR, 1960, 133-152)

TEXT: The interpolation method for the solution of the Dirichlet problem in the circle consists in the following : A harmonic polynomial is formed which on the circular periphery changes to a trigonometric polynomial and which interpolates the function given by the Dirichlet condition. The knots of interpolation are chosen equidistantly. If the given function is continuous then the trigonometric interpolation polynomial converges with respect to it in the mean, and with the aid of the Green's function it can easily be shown that the harmonic polynomial in every inner sub-region converges uniformly with respect to the sought solution of the Dirichlet problem. If the given function satisfies the condition of Dini-

Card 1/2

The solution of boundary value problems ..
Lipschitz then the interpolation polynomial converges uniformly with respect to it and the harmonic polynomial converges (according to a well-known theorem of the theory of harmonic functions) uniformly to the sought solution in the whole circle. Analogous results are obtained in the case of an ellipse by choosing the generalized harmonic polynomials as interpolation polynomials. Analogous results are also obtained for the Neumann's problem if the normal derivative of the interpolation polynomial interpolates the given normal derivative of the sought function on the boundary of the region. Some indications on the solution of the same problems for regions of a general form are given.

Abstract: solutions in the capillaries are transferred to the direction of the ends of the capillary. The position of the meniscuses of the solution in the capillaries is periodically observed under the microscope with an ocular micrometer. The basic problem of the investigation consists of the selection of such standard solutions in the capillaries as would be isotonic with the solution in the vessel or with the solution of the soil investigated; then, according to their determined concentrations, to measure the osmotic pressure of the solution investigated and the vapor expansion over it, which is necessary for calculating the evaporation rate of the water.

Reactions in thin films. A. I. Zel'm. *J. Phys. Chem.* (U. S. S. R.) 5, 1209-1300 (1931). On the basis of results on the hydrogenation of C_6H_6 in the presence of a colloidal Pd catalyst or of sapindin or of both, it is concluded that the reaction proceeds rapidly only when both are present, i. e., in the liquid phase in the walls of the colloid foam bubbles. The smaller those bubbles are, the more rapid is the diffusion and hence the reaction. The presence of sapindin, i. e., foam, increases the velocity of reaction 10 times at room temp. In the case of both $C_6H_6 + H_2$ and $CO + H_2$ mixts, the H_2 tended to collect in the upper layers of the foam owing to more rapid diffusion. P. H. Rathmann

active substances. A. J. Zettler, *Arch. Chem.*, **1**, 109 (1930); Khim. Referat. (U. S. S. R.), **11**, No. 2, 11-32 (1930). Khim. Referat. (U. S. S. R.), **11**, No. 2, 11.—The rate of evaporation of solns. containing surface-active components depends on the volatility of the given component. Attempts were made to confirm explicitly the supposition that in *oceanic* (contg. a nonvolatile surface-active component) the rate of evapn. must decrease. The rate of evapn. was studied on a soln. of dil. *sq. salicin* by the method of Raist. The evapn. curves for some cossesns. of urea, glycine, monobutyryl, tributyrin, eucerine, p-toluolamine, and safflower oil, were studied. The rate of evapn. of solns. of nonvolatile surface-active substances is always smaller than that of solns. of surface-inactive substances (if taken in equimolar analytical cossens.). The smaller the surface tension of the solns., the lower its rate of evapn. According to (cf.) the vapor pressure of the solns. and the mol. wt. can be deduced directly by the method of Raist only for surface-inactive substances. For surface-active substances it is necessary to introduce some corrections, depending on the surface tension of the solns. W. R. Hester

TITLE:

Use of nuclear emulsion of type K (K) for individual fast-neutron dosimetry

PERIODICAL: Atomnaya energiya, v. 13, no. 5, 1962, 467-471

TEXT: K-type nuclear emulsions 20 μ thick on triacetate backing designed for recording protons of 0.3-150 Mev were used to check 0.15-15-Mev neutron doses. An individual method was devised using a system of 13 layers: cellulose cardboard (58), Al(83); triacetate film (34.4); emulsion (6.9); triacetate film (17.2); black cellulose paper (13.3); emulsion backing (17.2); emulsion (34.4); Al (83), and cellulose cardboard (58). The data in the brackets are the layer thicknesses in mg/cm². On each side the emulsion is covered that the dependence of the number of tracks in the emulsion on the neutron energy is analogous to the dose absorbed in the biological tissue. This was checked by determining the contribution of

Card 1/3

S/089/62/013/005/004/012
B102/B104

Use of nuclear emulsion of type ...

each layer to the total number of tracks. A comparison of the dose curves as calculated shows that in the case of perpendicular irradiation, and for $E_n > 3$ Mev, the curve of the layer packet lies higher. The

calculations were verified experimentally with monochromatic neutrons (2.5, 3.6, and 14 Mev). It was found that in the case of perpendicular neutron irradiation the number N of tracks per cm^2 of emulsion is equal to the calculated number within the error limit. In the case of parallel irradiation N is by 50% smaller than with perpendicular irradiation. If a rotating packet of layers is irradiated, then N is 25% smaller than with perpendicular irradiation; in this case $N(E_n)$ agrees with the dose

curve of biological tissue to within $\pm 15\%$. The dose $D(\text{in rad})$ is calculated according to $D=AN$ where $A=(1.11+0.08) \cdot 10^{-5} \text{ rad/mrek}\cdot\text{cm}^{-2}$. The photoemulsions were treated according to the NIKFI standards, the films were scanned with an MEW-3 (MBI-3) microscope (950x). The nuclear emulsion was rendered sensitive to thermal neutrons by the presence of nitrogen; $N^{14}(n,p)C^{14}$ has a $\sigma=1.75$ b which decreases as $E_n^{-1/2}$ with increasing E_n . At 200 kev $\sigma=1.5$ mb and $E_p=0.56$ Mev. Hence this method

Card 2/3

Use of nuclear emulsion of type ...

S/089/62/013/005/004/012
B102/B104

makes it possible to measure the total thermal and the fast neutron dose; a Cd-filter is used to separate the two components. The γ -background becomes important only at doses above 5 r. At high γ -intensity the emulsion types Δ (D), T-3 (T-3) or ϑ -2 (Y_{α} -2) are used that are less sensitive to γ -radiation. The track regression was studied on K-type emulsions in a 70-day Po-Be-irradiation and it was found to lie within the error limits. It is the higher the less sensitive an emulsion to (recoil) protons. The K-type emulsion in the "correction packet" proves to be rather reliable (root-mean-square error in the determination of the monthly admissible dose +20%) and allows comparatively rapid scanning (85 films can be scanned by 1 person within 36 hrs). At present these packets are used for dosimetric monitoring of personnel in the Laboratoriya vysokikh energiy Ob'yedinenного instituta yadernykh issledovanii (High-energy Laboratory of the Joint Institute of Nuclear Research). There are 3 figures and 2 tables.

amplitude by means of an experiment involving registration of slow recoil deuterons from a film target of deuterated polyethylene 0.5-0.6 μ thick. The investigated range of the squared momentum transfer was $4 \leq |t| \leq 1.2$ (Debye 2). Plots are shown in Fig. 1. The curves are plotted in the space of $|t|$ corresponding to the energy of the recoil deuterons. The upper curve corresponds to the experimental data obtained at the temperature of liquid helium, while the lower curve corresponds to the theoretical calculation. The theoretical calculation was carried out with the help of the theory of the scattering of particles by a system of two centers. The calculations were carried out for the case of a spherical system of two centers. The radius of the system was taken to be equal to the radius of the deuteron. The scattering cross section was taken to be the same as the cross section of the deuteron. The calculations were carried out for the case of a spherical system of two centers. The radius of the system was taken to be equal to the radius of the deuteron. The scattering cross section was taken to be the same as the cross section of the deuteron.
