on pressure (up to 5,000 kgf/cm²) of some mineral oils, ricinus oil, and silicone liquids are presented. The experiments show that the dependence of the viscosity of mineral oils on the pressure is near the exponential law, and for silicone No. 3 it considerably differs from the latter.

AUTHOR: Zolotykh, Ye. V.

TITLE: Investigating the dependance of fluid viscosity on pressures up to 5,000 kgf/cm²PERIODICAL: Referativnyy zhurnal. Mashinostroyeniye, no. 5, 1961, 19, abstract 5E16⁴ ("Tr. in-tov Kom.-ta standartov, mer i izmerit. priborov" pri Sov. Min. SSSR, 1960, no. 46 [106], 81 - 95)

TEXT: The author presents a survey on the existing viscosity measuring methods indicating their errors. He describes a viscometer with free-falling steel ball the dropping of which can be observed visually through sight holes. The utilization of small-diameter balls makes it possible to use the viscometer for the investigation of low-viscosity fluids. The viscometer housing is fitted with an axial cylindrical channel 30 mm in diameter which, at the ends, is tapering off to 6 mm. In the narrow part interchangeable copying pipes are placed which hold the ball and impart to it the axial drop. The whole inner hollow of the viscometer is filled with the fluid. The diameter of the dropping ball is chosen, depending on the initial viscosity of the fluid, in the range of 0.6 - 5 mm. The

viscometer is adjusted perpendicular. To maintain the necessary temperature it is placed in a thermostatic bath. Together with the bath it can turn on ball bearings through 180° round the feeding pipes, one of which is connected to a hydraulic press. After the necessary pressure has been produced, the viscometer is disconnected from the press. The author investigates the methods and results of investigations of various fluids at temperatures of 14 - 40 - 50 - 35°C and at various pressures. The errors of the viscometer at atmospheric pressure amount to $\pm 2\%$. Readjustments caused by high pressures are insignificant and are determined by calculation. The total error at a pressure of 5,000 kg/cm² at a temperature maintained with an accuracy of $\pm 1^\circ$ does not exceed $\pm 5\%$. There are 2⁴ references.

Illus. 3

The dominant mosquitoes in the areas are *Aedes* species (*A. vexans*, *caspius*, *sticticus*, *rossicus* and *hungaricus* Mihelyi n. sp.). The procreation begins immediately with the flood, if the water temperature is over 10° C. Larval destruction should be started at this moment to inhibit the breeding. DDT spraying of the vegetation in the flood area and its surroundings is a very suitable measure for this purpose, which has a lasting effect until the next flood. By means of spraying machinery with tractor locomotion or from aircraft, extensive areas, including woodland, can be dealt with in a short time.

AUTHOR: Zeloyev, T.M. and Imanayev, N.G.

TITLE: Quality of Oil Well Plugs and Methods for Testing and Improving the Tightness of Cement Collars at the Lower End of Casing Columns (O kachestve tamponazha skvazhin i metodakh proverki i ispravleniya nezernostichnosti cementnogo kol'tsa na kolonnye)

PERIODICAL: Neftyanoye khozyaystvo, 1958, Nr 7, pp. 38-44 (USSR)

ABSTRACT: The article states that leaky cement collars at the lower end of casing columns, poor quality of cement, and the off-center position of some casing columns (Fig. 1) lead to premature flooding of wells at the Tuyazy oilfield. The authors made a study of flooded wells and presented the experimental data in Table 1. The quality of plugging cement employed is presented in Table 2. The cement plugs were tested by pumping activated fluid into the well according to a method proposed by MFT im. akad. I.M. Gubkina (MFT im. acad. I.M. Gubkin). It was determined that when the cement plugs were of good quality the radioactive isotopes penetrated only the perforated interval (Fig. 2). When the cement plugs were defective the radioactive isotopes penetrated up to the lower water-bearing horizon or to the water-bearing sector in the uniform layer (Fig. 3). The quality of defective plugs was improved by pumping cement slurry into the filter of the column by means of a hydraulic press according to the method of V.D. Malevanskiy (Ref.2). Fig. 4 shows the good results obtained by this method as well as by using the fine cements of UfNIK (Ref.3). The injection of cement into the layers with the aid of hydraulic fracturing was carried out according

Card. 1/2

Quality of Oil Well Plugs and Methods (Cont.)

Sov/93-58-7-8/17

to the method described by A.K. Krupnov and N.G. Imanayev in their article "Blocking of Bottom Water at the Tymazaneft' Oilfields by Hydraulic Fracturing of the Formation" (Izolyatsiya podoshvennykh vod s primeneniem gidrorastryva plasta na promyslakh Tymazanefti), published in Neftyanaya khozyaystvo, 1957, Nr 11. The good results obtained with this method are shown in Figs. 5 and 6. Use was also made of the VNII method requiring injections of ureid-formaldehyde resin into the formation. The authors point out that defective cement plugs produce oil of high water content (Fig. 7), and they make seven suggestions on how to eliminate the premature flooding of wells. There are 7 figures, 2 tables, and 4 Soviet references.

TITLE: The Rate and Ampleness of Output of the Oil Deposits
(Tempy i polnota vyrabotki zaleshey nefti)

PERIODICAL: Neftyanoye khozyaystvo, 1958, Nr 10, pp 31-35 (USSR)

ABSTRACT: The Tuymazy Oilfield was discovered in 1944 and the initial estimate of petroleum reserves in the D_I and D_{II} formations was made in 1949. A second estimate was made by the VNII Institute in 1954 and a third by the Tuymazaneft' NPU in 1957. The capacity of the D_I and D_{II} formations are given

in Figs. 1-2 and the production rates in relation to the initial and current estimates of reserves are given in Tables 1-3. The data show that the actual production coefficient for the two formations is 0.43 instead of 0.58 as determined by the initial estimate of the reserves. The low production in relation to the reserves presents a serious problem for the further development of the large Devonian oilfields, but the scientific and research organizations do not bother to analyze the industrial data on the D_I and D_{II} formations. There are 2 figures and 3 tables.

TITLE: A method for manufacturing tuberculin. Class 30, No. 173381

SOURCE: Byulleten' izobretens i tovarnykh znakov, no. 15, 1965, 73

TOPIC TAGS: tuberculosis, immunology, allergen

ABSTRACT: This Author's Certificate introduces a method for manufacturing tuberculin. The method consists of growing a tubercular culture on a nutrient medium, removal of the bacterial matter and filtration. An active and specific allergen is produced and labor-consuming operations are reduced by exposing the culture to Co⁶⁰ γ -radiation.

"The Incidence of Entamoeba Histolytica Infections Within Families (Communities), in Hungary."

Budapest, Orvosi Hetilap, Vol 107, No 11, 13 Mar 66, pages 502-504.

Abstract: [Authors' Hungarian summary] Among the 338 members of 105 families, 63 per cent gave positive results in comparison with a 26 per cent positivity found among hospitalized cases which were tested because their clinical symptoms gave rise to a suspicion of the presence of infestation. These data confirm the theory that *E. histolytica* infestation is characterized by a familial concentration. This concentration must be taken into consideration in the diagnosis of the disease, the setting up of epidemiological measures and in therapy as well. In practice this means that, in the presence of a diagnosis of *E. histolytica*, every member of the given family or closely knit community must be tested. Those found to be positive must under-

AUTHOR: Zoltai, Zoltán

TITLE: Application of the light diffraction phenomenon for controlling machine tools

PERIODICAL: Gép, no. 8, 1961, 299-301

TEXT: The article deals with the problem of using the phenomenon of light diffraction, mainly that of moiré fringes, for controlling automatic machine tools. The author draws the attention of Hungarian machine tool designers and builders to this possibility, since, during the coming 10-15 years, the Hungarian machine tool industry will be faced with a large-scale development program for the achievement of which the methods discussed here could play an important role. Reference is made to the research carried out in this field in Great Britain by the National Physical Laboratory and the National Engineering Laboratory, as well as to the practical work of Ferranti Ltd and Ultraelectric Co. Ltd, on which most of the data presented in the article are based. After a brief description of the

Card 1/2

H/011/61/000/008/001/001

Application of the light diffraction phenomenon for controlling machine tools

physical characteristics of light diffraction and of diffraction gratings, and an indication of some methods of manufacturing such gratings for producing moiré fringes, the author proceeds with a presentation of several examples on the practical application of the phenomenon in controlling machine tool operations. The main advantage of this method is the elimination of the possibility of transferring the effect of the machine tool failure to the products. There are 5 figures and 3 non-Soviet bloc references. The three references to English language publications read as follows: The NPL and NEL: Moiré fringes for measurement and control; D.V. Blake and L.A. Sayce: Machine tool monitor using diffraction gratings. Trans. Soc. Instrum. Tech. 1958. 10 (4) p. 190-196; J. Guild: Diffraction gratings or measuring scales. London, Oxford University Press 1960.

5712. REPLACEMENT OF THE ALAE NASI - Ergatz der Nasenflügel - Zoltán J. Budapest - ZBL.CHIR. 1958, 83/8 (345-557) illus, 10

A few methods of reconstruction of the alae nasi are described on the basis of the literature and personal experience. The best results can be obtained with a so-called compound graft from the ear, which resembles the alae of the nose most in respect of structure. Its transplantation is a simple, safe and quick process. This old procedure, which has dropped into oblivion and has been renewed in the last 10 yr., allows almost complete abolition of local operations and has limited the indications of plastic surgery using round pedicles and flaps. (IX, 19)

special reference to the separation of the almost completely united fingers MAG. SOBÉSZET 1956, 6/4 (209-216) Illus. In united fingers or where there is a cessation of the normal separation process the author reports 17 cases treated by Burian's method of operation. After development of the interdigital fold by 2 triangular flaps he makes a saw-like zig-zag incision on both the volar and dorsal surfaces. In this manner the interdigital fold and its function is not affected. The skin defect is covered by grafting. Excellent results.

"Some Notes on Pathological Observations and Clinical Procedures in Obstetrics."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 19-20, 6-13 May 63, pp 709-713.

Abstract: [Author's English summary modified] Author reviews some of the modern developments in obstetrics and notes the decline in mortality, and the near-disappearance of puerperal fever or fatal hemorrhage. On the other hand, pregnancy toxemia, or complications due to defects of the heart muscle or to diabetes are more frequently observed. The author is a strong advocate of Caesarian section for delivering mothers with heart trouble, since studies on the oxygen consumption and effect of 17 corticoids revealed that the charge of the patient from the operation is less than from the labour pains. 15 refs: 2 Hungarian, 1 German, and the others Western.

The disabilities caused by through and through loss of the cheek are discussed. There are 3 main types of procedures available for reconstruction: (1) repair by use of surrounding tissue; (2) repair of one surface from surrounding tissues and reconstruction of the other wall by tissues taken from a distant site; (3) full thickness repair with all tissues taken from distant sites. The first named method is preferable but is seldom feasible. Detailed descriptions of procedures used in 2 cases are presented.
