The drying of wood vinegar in an atomized condition, R. R. Skubanski and G. M. Zorlu, *Lacquer*, 1946, Vol. 2, No. 8, 16-22 (1949); *Chem. News*, 1949, I, 616. In order to accelerate the drying of solids in wood vinegar they were finely sprayed and dried at various temps. The greatest success was found. Loss by decomposition of the acetain was greatly reduced (down to 2-3.5%) by keeping the initial temp. of the gases at 430-50° and the final temp. at 140-160° and in solids, cooling the gases as rapidly as possible after their introduction into the drying chamber. This was accomplished by reducing the particle size to 0.15-0.3 mm., i.e., by the use of compressed-air jets (air pressure 0.6-1.2 atm.) or by increasing the density of the spray. M. G. Moore

TITLE: Results of tests of mock-ups and samples of acoustic logging equipment and some prospects of its use

SOURCE: AN SSSR. Institut fiziki Zemli. Geoakustika; ispol'zovaniye zvuka i ul'trazvuka v seismologii, seismorazvedke i gornom del'e (Geoaoustics; the use of sound and ultrasound in seismology, seismic prospecting, and mining). Moscow, Izd-vo Nauka, 1966, 77-84

TOPIC TAGS: acoustic logging, well logging, ultrasonic logging, digital computer, seismic logic instrument, engineering machinery

ABSTRACT: The development of pulse acoustic logging equipment in the Leningrad Branch of VNIIGeofizika and VIRG (All-Union Scientific Research Institute of Prospecting Geophysics) since about 1956 is described. The first field test of acoustic logging equipment was made at Ramenskiy well 1 in 1957. A three-element well device containing magnetostrictive emitter and two receivers was used in the experiment. Digital analog computers to determine the formation velocity and total time from the first arrivals were developed by VIRG and LETI (Leningrad Electrical Engineering Institute) in the period 1958—1960. In 1962, industrial tests were made of an experimental model of the LAK-1 acoustic logging device which had been developed by VNIIKAneftegaz and

ABSTRACT : cent higher than the herd's average milk fat content for three generations. In Sweden, artificial insemination of cows constitutes a basic measure which assures the increase of the milk's fat content. In 1956, 40 percent of the cows were thus inseminated. There are 35 stations for artificial insemination in the country. Each station possesses 30-40 bulls and the average load for a bull amounts to 1,300 cows. All sires are kept in premises with daylight, there are riding

AUTHOR: Sliz'ko, I.F. and Zorin, L.F., Engineers

TITLE: Machines and Devices for Mining in Frozen Ground in Winter (Mashiny i prisposobleniya dlya razrabotki merzlykh gruntov v zimniy period)

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, 1959, Nr 2, pp 15-18 (USSR)

ABSTRACT: The article deals with mining problems in open-cut mines in winter, when the multi-bucket excavators cannot work satisfactorily (frequent break-downs), because of the frozen ground. The authors recommend the following methods: 1) the warming-up and defrosting of the mine benchings by means of electrodes driven into the ground vertically or horizontally. This method is expensive and may be used only in small open-cut mines; 2) the preliminary loosening-up of the frozen ground using SE-3 excavators; 3) the blowing-up of the frozen ground. Electric drills of the EBR-19D type are used for the boring of blast holes.

Card 1/2

SOV/118-59-2-4/26

Machines and Devices for Mining in Frozen Ground in Winter

The firing is carried out in series of 12. This method has been successfully used by Metrostroy, "Elektrostal'-stroy", "Soyuzekskavatsiya" and during the building of the Moskovskiy energeticheskiy institut (the Moscow Institute of Power Engineering); 4) the use of drag-line excavators mounted on S-80 tractors (the most economical method); and 5) the use of diesel hammers mounted on S-80 tractors, E-505 excavators, tractor loaders and special framings. The application of diesel hammers mounted on D-157 bulldozers has been recommended by engineer I.N. Sokolov and was used while building the Institute of Power Engineering in Moscow. There are 4 diagrams, 1 photograph, and 1 table.

AUTHORS: Sliz'ko, I.F., and Zorin, L.F., Engineers

TITLE: The Operating Experience of the DGI and PKF-60 Mining Combines (Opyt raboty kombaynov DGI i PKF-60)

PERIODICAL: Mekhanizatsiya Trudoyemkikh i Tyazhelykh Rabot, 1958, # 3, pp 26-28 (USSR)

ABSTRACT: In October 1955, the mining combine "DGI-2M", for the driving of drainage levels, was put into operation at the Baydakov mines. This combine was designed by the Dnepropetrovskiy gornyy institut (Dnepropetrovsk Mining Institute) and the Institut gornogo dela akademii nauk Ukrainskoy SSR (Mining Institute of the Ukrainian Academy of Sciences), in cooperation with manufacturers of the Trest Nikopol'-Marganets (Nikopol'-Manganese Trust).

In March 1956, the mining combine "PKF-60", designed by the Konstruktorskiy byuro koksokhimicheskoye mashinostroyeniya chernoy metallurgii (Designing Bureau of the Coke-Chemical Machine Construction Plant of Ferrous Metallurgy) was tested at the "Aleksandriyskaya" mine No 2.

The main parts of both combines are: 1) the underframe, 2) the rotary and feed mechanism, 3) the cutting mechanism,

Card 1/2

118-58-3-9/21

The Operating Experience of the DGI and PKF-60 Mining Combines

4) the electrical parts, 5) the loading and unloading conveyors, 6) the instrument panel, 7) the hydraulic mechanism and 8) a device for the removal and loading of coal onto the loading conveyor.

Both combines are said to have shown certain deficiencies. The chain-tread reducing gears of the type "DGI-U-1" are too weak and the specific pressure of the type "PKF-60" is too high, causing difficulty in operation.

Of all level-driving mining combines, types "DGI-2M" and "DGI-U" were most suitable for exploitation at the Dnepr Lignite Coal-Fields.

There are 3 graphs and 3 tables.

TITLE: Formation of the Selenga Delta and the Proval Bay
(Formirovaniye del'ty Selengi i obrazovaniye zaliva
Proval)

PERIODICAL: Uch. zap. Mosk. un-ta, 1956, Nr 182, pp 193-196

ABSTRACT: The author believes that the Proval Gulf in Lake Baikal was formed due to ground shrinking caused by violent earthquake "jarring." Observations demonstrate that different amounts of alluvial accumulation are deposited in different sections of the Selenga River delta, on which the Proval Gulf abuts; consequently, various deposits are consolidated to a different degree. As V. A. Florinov showed (Izv. AN SSSR Otd. tekhn. n, 1952, Nr 6), particles of earth begin to "float" in water and the ground "liquefies" and subsequently contracts, when the ground with quicksand potential is dynamically dis-

Card 1/2

Formation of the Selenga Delta (Cont.)

turbed. The form of the bay adjacent to a section of the delta, and ground water rise in wells after an earthquake, support this hypothesis about the bay forming due to the contraction in the deposits and the occurrence of subaqueous mud flows.

TITLE: Structural Peculiarities of the Lower Parts of the Anga and Bugul'deyka Rivers (Western Baykal Area) and Their River-Bed Activity (Osobennosti stroyeniya dolin nizoviy rek Angi i Bugul'deyki (Zap. Pribaykal'ye) i ikh ruslovoy deyatel'nosti)

PERIODICAL: Izvestiya Akademii nauk SSSR - Seriya geograficheskaya, 1958 Nr 5, pp 59-64 (USSR)

ABSTRACT: Information is given on the relief formation of the Bugul'deyka and the Anga rivers, flowing into Lake Baykal. The character of both river valleys is described, and it is stated that the Anga is a "semi-mountain" river type whereas the Bugul'deyka is a typical mountain river. The Anga river-bed contains all elements formed during the erosion-accumulative process period, i.e. sandbanks; pools; meanders; shoals; sand bars and isles. The Bugul'deyka river is characterized by the absence of regular meanders, formation of so-called blocking loopings in the bank zones of the river bed; absence of large alluvial deposits and well defined terrasses, and frequent alternation of narrowing and widening of the valley. The difference in the valley structure of the two rivers is explained by the fact that

Card 1/2

Structural Peculiarities of the Lower Parts of the Anga and Buguldeyka
Rivers (Western Baykal Area) and Their River-Bed Activity

SOV/10-58-5-9/28

the Anga is a "mature" stream and that its evolution reached
the stage where a certain portion of the current power is
spent on the side migration of the river bed. The Bugul-
deyka, on the other hand, spends most of its power on the
subsurface embedding. These differences are mainly caused
by different current turbulences.

AUTHOR: Zorina, A.

TITLE: An Epic About Glass

PERIODICAL: Nauka i zhizn', 1959, Nr 9, pp 37 - 38 (USSR)

ABSTRACT: The article deals with an exhibition of Czechoslovakian glass in Moscow. About 30,000 exhibits include not only the most various kinds of glass and glass products but also its application from the finest filament, with a thickness of some microns, up to a pipe of fused basalt, the strength of which surpasses by some times the strength of cast iron. The author gives a short survey on the development of the Czechoslovakian glass industry which is traced back to the 10th century. Nowadays, Czechoslovakia exports glass products to 120 countries. The Soviet Union imports above all crystal glass and laboratory equipment. The exhibits are divided into three fundamental kinds: everyday and artistic glass, technical glass and trinkets. Besides this, the exhibition shows the most modern production methods. The glass specialists are trained at the Artistic-Industrial

An Epic About Glass

SOV/25-59-9-14/49

Higher Educational Institution in Prague under the leadership of Professor Karel Stipl and Josef Kaplicky. The Technical School at Zelezny Brod is guided by Stanislav Libensky. At Novy Bor there is a Technical School for Glass Manufacturing Machinery and a Trade School for Training in Cutting and Engraving Glass. One of the most capable masters is the creator of glass figures, Miroslav Klinger. The author gives some general details on manufacturing glass. He mentions the famous Czech pipe conduit manufactured of "SIAL" type glass. About 5,000 km are already laid on the territory of Czecho-Slovakia. The building department of the exhibition shows glass blocks which, combined with concrete, withstand a load of 120 to 2,000 kg per sq m. Presently, 30 various types of such blocks are being manufactured. The Experimental Institute at Jablonec is very important for the trinket factories. TITLE:

A Submarine Laboratory (Podvodnaya Labora-toriya)

PERIODICAL:

Nauka i zhizn', 1959, Nr 2, p 17-18 and p 2
of centerfold (USSR)

ABSTRACT:

This article deals with the construction and equipment of and the tasks to be performed by the submarine "Severyanka", the "submarine laboratory". On 14 December 1958, the vessel put to sea for its shake-down trip. On board the ship was an expedition of the Vsesoyuznyy nauchno-issledovatel'skiy institut morskogo rybnogo khozyaystva i okeanografii (All-Union Scientific Research Institute of Sea Fishing and Oceanography). The ship is equipped with the newest Soviet apparatus. All the water surrounding the hull is surveyed by highly sensitive hydroacoustic devices. With their aid the ichthyologists

Card 1/3

A Submarine Laboratory

SOV/25-59-2-6/48

can determine the distribution and approximate outlines of fish schools. The submarine has three illuminators; two on starboard and port, and one which is directed upwards. The "Severyanka" has two sounding apparatus with self-recording devices. One of them emits ultrasonic waves upwards, to the surface of the sea, the other - down, to the sea bottom. The reflected signals immediately inform the scientists of the appearance of fish or other marine organisms. An electronic thermosalinometer determines the temperature and salt content of the water, and a special device for taking water permits its analysis and measuring for radioactivity. One of the main tasks of the submarine is the finding and tracing of shoals, a task, whose importance is demonstrated by the fact that the Soviet Union wants to increase her catches from 29 million centners in 1958 to 46 million centners in 1965.

Card 2/3

A Submarine Laboratory

SOV/25-59-2-6/48

The team is also concerned with geological, oceanological and other research. During their cruise, the scientists could observe molluscs, medusae etc. through the illuminators at a distance of 10-20 m. Three times the boat went to the sea bottom. In 1959, the "Severyanka" will carry out several scientific expeditions into the fishing areas of various seas and oceans. For its second expedition the ship went out to the Atlantic into the Soviet fishing areas. There are 2 drawings and 1 photo.
