Elektrotech. Ouzor, Vol. 47, No. 6, 316-21 (1938). In Russ.  
An analysis of transients for the case of short-circuit at the terminals of a d.c. series motor. It is assumed that the magnetic flux is directly proportional to the m.m.f.; the influence of eddy currents is represented by R, L and M in the equivalent circuit. According to analysis, current peaks of the transient can reach values several times higher than the steady-state value before the short-circuit. Measurements on an older type traction motor resulted in peaks three times the steady-state value. N. Klein

PHASE I BOOK EXPLOITATION CZECH/4338

Pašta, Jan, Professor, Engineer, Doctor, Vojtěch Kulda, Engineer, Zdeněk Zoubek, Engineer, Jan Kopeček, Engineer, Zbyněk Vlášek, Engineer, Bedřich Pádarta, Engineer, Miroslav Kondr, Engineer, Miloš Frydl, and Jiří Kulda, Engineer

Měření na elektrických strojích. [sv.] 2: Měření na transformátorech (Measurements of Electric Machines. v.2: Measurements of Transformers) Prague, SVTL, 1959. 247 p. 2,700 copies printed.

Reviewer: Vladimír Hrbek, Engineer; Resp. Ed.: Ladislav Ženíšek, Engineer;  
Chief Ed.: František Kašpar, Engineer, Doctor; Tech. Ed.: Marie Králová.

PURPOSE: This book is intended for electrical engineers concerned with transformer problems.

COVERAGE: The book constitutes the second part of a collective work on measurements of electrical machines. It contains a list of preliminary operations in testing transformers and on measuring individual quantities: mechanical,

Card 1/15

Measurements of Electric (Cont.)

electric, magnetic, and thermal. Testing procedures for special transformers, transducers, reactors, and choke coils are also treated. The equipment used in test rooms, the testing methods, and the preparation of the results of measurements are described. Engineer Vojtěch Kulda wrote most of Chapters I, III, XVII, XIX, XXI, cooperated in writing Chapters II, VII, VIII, IX, XI, XII, XIV, XX, XXIV, and contributed to Chapters IV, V, VI, XV, and XVI. Engineer Zdeněk Zoubek wrote most of Chapters IV, V, VI, VII, IX, X, XXIII, cooperated in writing Chapters II, VIII, XI, XII, XXIV, and contributed to Chapters I and XVI. Professor Engineer Doctor Jan Bašta wrote most of Chapters XIII, XVI, XXII, cooperated in writing Chapters VIII, XII, XIV, XVII, and contributed to Chapters XV, XVIII and XX. Engineer Jan Kopeček wrote most of Chapters XV and XX, cooperated in writing Chapters VIII, XII, XIV and XVII, and contributed to Chapters I and XVI. Engineer Bedřich Paderta cooperated in writing Chapter I and contributed to Chapters II, III, IV, VI, VII, VIII, XI, XII, XV, XVI, XIX and XX. Engineer Zbyněk Vlášek cooperated in writing Chapters I, XVII and XXIV, and contributed to Chapters IV, VIII and XII. Engineer Miroslav Kondr cooperated in writing Chapters XIV and XV. Miloš Frýdl wrote Chapter XVIII. Engineer Jiří Kulda cooperated in writing Chapter XIV and contributed to Chapter XV. The editors thank Engineer Doctor Jiří Lammeraner, Corresponding Member of the Czechoslovak Academy of Sciences and Engineer V. Hrbek. References follow each chapter.

TITLE: Rheoencephalography *22*

SOURCE: Československa neurologie, no. 1, 1966, 33-41

TOPIC TAGS: encephalology, diagnostic medicine, EEG, neurologic surgery, central nervous system, blood circulation, nervous system disease, rheoencephalography

ABSTRACT: Development of rheoencephalography is described. The basis of the method is discussed; differences between the blood circulation in the brain and other body parts are evaluated. Best conditions for registering the rheoencephalographs are discussed. Characteristic curves found by encephalography are described and their evaluation discussed. The use of rheoencephalography in diagnosis of some diseases is described. Rheoencephalography can be used to study the changes in hemodynamics of the brain in inflammations, and in blood vessel and tumorous diseases of the CNS. It can be combined with EEG in neurological and neurosurgical work.

"Paroxysmal Tachycardia in the EEG."

Prague, Ceskoslovenska Neurologie, Vol 29, No 3, May 66, pp  
186 - 193

Abstract /Authors' English summary modified: In 21 patients suf-  
fering from paroxysmal tachycardia neurological as well as EEG ex-  
amination was performed. 16 EEG recordings were abnormal. In 7  
cases there were signs of a temporal focus, in 5 there was bilateral  
asynchronous slow activity, and in 4 the graph was flat. When re-  
cordings were made during paroxysm the abnormality was more pro-  
nounced. The structures of the temporal lobe contribute to the  
so-called idiopathic paroxysmal tachycardia. Treatment of temporal  
epilepsy is discussed. 4 Figures, 8 Western, 2 Czech references.

TITLE: Means of using reoencephalography in neurology [This paper was presented at the meeting of Slovak neurologists at Modra-Harmonia, 25-27 June 64.]

SOURCE: Ceskoslovenska neurologie, no. 3, 1965, 239

TOPIC TAGS: neurology, encephalology, brain, nervous system disease, circulatory system disease, clinical medicine

ABSTRACT: Reoencephalography (REG) is a simple method that offers an examination method not burdening the patient. It is suitable for investigation of the hemodynamics of the brain. Simultaneous REG and EEG offer special advantages. 70 healthy subjects and 30 neurological patients were investigated by the method; the results are discussed. Arteriosclerosis of the brain and of the brain-supplying arteries can be diagnosed easily by this method. [JPRS]

636. ZOULA J. Praha-Podolí. \*Vylučování amino n při parenterálním podávání kaseinových hydrolyzátů. The excretion of amino-acid nitrogen following parenteral administration of casein hydrolysate ČSL. PEDIAT. 1955, 10/4 (281-286) Graphs 1

Casein hydrolysate was administered parenterally by i.v. infusion (4-6 drops/min.) to 6 children - 3 with gastroenteritis and 3 premature infants - in a total amount of 100-400 ml. (i.e. 5-20 g. of dry preparation), according to the weight of the child. The levels of free amino nitrogen, urea and uric acid in urine and the changes in protein fractions of blood serum by filter paper electrophoresis were investigated. A portion of administered nitrogen (10-15%) was excreted in the urine in the form of amino nitrogen. The highest levels of amino nitrogen were observed during the infusion, and 2 to 4 hr. later fell to normal again. Parallel with this the levels of urea and uric acid rose, but their return to normal levels was slower (in 13-20 hr.) Qualitative alteration in excreted amino-acids was observed only during the infusion. After the infusion all amino-acids not normally found in the urine rapidly disappeared. It was found that infusion of casein has no significant influence on serum protein fractions.

Title : A Discussion Concerning the Exploitation and  
Life of Pot Furnaces.

Orig Pub: Sklar a keramik, 1958, 8, No 4, 117-118.

Abstract: It is pointed out that most frequent cause in  
disrupted operation of pot furnaces is the des-  
truction of burners -- the most strained part of  
the fire-box. The results of temperature measure-  
ments in various sections of a twelve-pot furnace  
are given as well as the analysis of the mixture  
of generator and heating gases fed to the burner.

of the kiln. Various methods are described for firing the batch (manual and semiautomatic). The composition of the firing gases and their calorificity, is cited as well as data concerning the temperature and its distribution in the kiln space, and inspection of the thermal condition and draft of the kiln.

IV. An investigation of kilns was conducted from the point of view of their capacity; that is, the volume of the vessel and of the area of the kiln hearth corresponding to it. Six types of potters' kilns of the Simens system and one of the type of the Knoblaukh systems are established. The following claims are made for these types of potters' kilns: uniform technical and economic indices; minimum expense in the construction and reconstruction of kilns; simplification of

TITLE: Borehole refraction method

SOURCE: Ceskoslovenska akademie ved. Geofyzikalni ustav. Geofyzikalni sbornik, v. 12, 1964. Prague, 1965. Prace, no. 196-214, 199-224

TOPIC TAGS: seismic prospecting, refracted wave, seismic logging  
borehole logging, *ACOUSTIC REFRACTION, SEISMIC WAVE*

ABSTRACT: The paper presents a method of interpreting measurements using a geophone located in a borehole below the refraction interface for recording waves excited on the surface. For the sake of brevity, this was called borehole refraction method. The paper deals primarily with numerical methods permitting the coordinates of the corresponding refraction point on the interface to be calculated from the field of ray times. Both the direct and the inverse problem were solved for a plane interface with inclination  $\phi$ , as well as some methods of calculating the relative elevations with respect to the comparative horizontal

Card 1/3

I 36115-66

ACC NR: AT6016647

level. These methods give only approximate results. The calculation of the depth corrections and corrections for the displacement of the point (vector displacement) is intended primarily for relatively small elevations from the comparative level. As exemplified on models in the paper, even when the elevations are large, relatively satisfactory results are obtained by using relations  $(p = (z_0 - \Delta z)v_1 / \sqrt{v^2 - v_1^2})$  or  $(\Delta z = \Delta t \cdot K)$ . These methods are intended for quick evaluation of the results during the actual work so that the measurements can be supplemented where required. For the final treatment of the results, a numerical method is elaborated which permits the calculation of the coordinates of the refraction point if the ray time, the values of the apparent velocity, and the slope of the displacement vector (normal to isochrone) are known. The appropriate values are best obtained from the ray-time field by using a square network of points. The method is analogous to the graphical method of solving this problem according to L. M. Gardner: [Seismograph Determination of Salt-Dome Boundary Deep on the Dome Flank. Geophysics, 14 (1949), 29]. The advantage of this method is that it eliminates the necessity for three-dimensionality. A disadvantage is that in the first medium the velocity is considered to be constant and not variable with depth  $z$ . The three-dimensional solution by the graphical method using A. W. Musgrave, V. C. Wodley, H. Gray: [Outlining Salt Masses by Refraction Methods. Geophysics, 25 (1960), 141], permits

the use of wavefront charts which consider given velocity conditions. When interpreting the travel-time curves constructed from measured ray times, we consider only the first arrival. The type of wave recorded is not known exactly. The inverse problem will be made more difficult, particularly by the diffracted waves appearing in the first arrivals. The effect of the irregular configuration of the interface on the type of travel-time curves of the different waves was studied on several models representing a horst and a graben. It is clear from the inverse problems that the occurrence of diffracted rays greatly interferes with continuous study of the interface. The data on diffracted waves obtained from the models studied can then be applied in real measurements. For a more detailed study it would be more advantageous to carry out laboratory model measurements for different types of interface configuration. This would permit a study not only of the kinematic but also of the dynamic characteristics for distinguishing different types of waves. Better interpretation would contribute to the study of later wave arrivals. Orig. art. has: 15 figures and 12 formulas. [Author's abstract] [KS]

Tris(hydroxymethyl)phenol and its preparation. J. Pochwalski and J. Zowall (Inst. Twor. Sztucz. Warsz. Przemysl. Chem. 55, 454-457 (1958)). 2,4,6-Tris(hydroxymethyl)phenol (I) is always found to be present when HCHO and PhOH undergo condensation. The various methods described in the literature are discussed and it is found that the method of Martin (C.A. 46, 7540h) is the one preferred, where the I is prepd. 1st as the Na salt. From this salt with addn. of H<sub>2</sub>SO<sub>4</sub> keeping the pH strictly at 7, with addn. of EtOH in the later part of the prepn., the I may be prepd. in 60% yield. The whole reaction, starting with 1 mol HCHO, may be done in one reaction vessel if after the end of the condensation the excess HCHO is removed with NaHSO<sub>3</sub>. Co i jak produkować i tworzyć sztucznych (What can be produced from plastics and how) Warszawa, Państwowe Wydawnictwo Techniczne, 1959, 413 p. (Series: Tworzywa sztuczne przetwarzane i zastosowania) Warszawa slip inserted. 5,253 copies printed.

Coordinator of the work: J. Brzezinski, Master of Engineering; Reviewer: St. Chudzyński, Master of Engineering; Scientific Ed. of Publishing House: St. Piastus, Master of Engineering and K. Bedziwiłł, Master in Science, Tech. Ed.: A. Urbanicki.

PURPOSE: This book is intended for chemists and equipment designers in the plastics industry. It will be of interest to students of the plastics industry.

COVERAGE: This book, one of a series on the plastics industry, is divided into two parts. The first part discusses the classification of plastics, methods of production, and the most common uses of the end-products. The basic properties of individual plastics are given in tabular form along with testing methods. The second part contains a general discussion of all known methods of processing plastics, thermoplastics, and thermosetting plastics. The design, construction, and parts of processing machines are described. The plastics used in the production of various articles are listed. The plastics used in the plastics industry are listed. A listing of technical used in the plastics industry is included. A table includes the trade names and producers of major plastics. No references are given.
