TITLE: Effect of monoenergetic 14.2 Mev neutron irradiation on the conductivity of germanium

PERIODICAL: Referativnyy zhurnal, Fizika, no. 12, 1962, 66, abstract 12E471 ("Glasnik mat.-fiz. i astron.", 1961, 16, no. 1 - 2, 121 - 123, English; summary in Serbo-Croatian)

f

TEXT: The conductivity variations of n-Ge irradiated by a flux of 14.2 Mev neutrons was investigated. The initial conductivity of the specimens was  $0.2837 \text{ ohm}^{-1}\text{-cm}^{-1}$ . In order to reduce the effect of the temperature variations of the surrounding medium, the specimens were placed in a thermostat (temperature  $30 \pm 0.05^\circ\text{C}$ ). The conductivity variation of the specimens after 15 hour-irradiation by a flux of  $5.10^8$  neutron/sec was as low as  $\sim 0.75\%$ . In the specimens which were not placed in the thermostat even that small variation was not noticed. The rate of removal of the carriers was determined as equal to 25 carriers per neutron. A possibility was obtained to detect the dependence previously assumed (RZh Fiz, 1960, no. 9, 23850) of the carrier removal rate on the initial carrier

TITLE: Angular distribution of fast neutrons elastically scattered on Ca

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 47 - 48, abstract 8B340  
(Bull. Acad. polon. sci. Sér. sci. math., astron. et phys., 1961,  
v.9, no. 8, 621 - 623; English; summary in Russian)

TEXT: Measurements of elastically scattered neutrons were conducted simultaneously at  $30^\circ$ ,  $60^\circ$ ,  $90^\circ$ ,  $120^\circ$ , and  $150^\circ$ . The neutrons were recorded using an Agfa K2 100- $\mu$  photographic emulsion. A Ca specimen 3 cm high and 2 cm in diameter was irradiated by a collimated neutron beam from the BBP-C (VVR-S) reactor. The lower limit of the neutron energy spectrum could not be lower than 1 Mev on account of the background. Angular distribution curves are presented for scattered neutrons in the 1 - 2 and 2 - 3 Mev ranges. Attention is directed onto the forward-backward asymmetry. To explain this circumstance, one has to allow for a direct interaction between neutron and nucleus, besides the scattering process from the composite nucleus. ✓e

ACCESSION NR: AP4008534

P/0031/63/008/004/0373/0386

AUTHOR: Manitius, Jan; Zur, Andrzej

TITLE: Region of optimum operation for a controlled rectifier during automatic voltage regulation

SOURCE: Archiwum automatyki i telemekhaniki, v. 8, no. 4, 1963, 373-386

TOPIC TAGS: automatic voltage regulation, voltage control system, controlled rectifier, polyphase controlled rectifier, optimization, optimum operation region, static error, rectifier firing angle, relative voltage error, rectifier control angle, phase-shift rectifier control

ABSTRACT: The article deals with the operation of a phase-controlled rectifier with automatic voltage regulation. The closed-loop system analyzed here includes a phase-shift type of firing angle control and a proportional type voltage regulator. The static error is derived first in terms of supply voltage variations, then in terms of reference voltage variations and finally in terms of external disturbances, i.e. load changes. The optimum firing angle is established in regard to minimum voltage error under these quasistatic conditions. This optimum

Card 1/2

ACCESSION NR: AP4008534

lies between  $30^\circ$  and  $45^\circ$  depending on the total gain in the voltage correcting system. Such magnitudes of firing angle are in excess of those considered essential for efficient energy conversion in the rectifier device. It remains, therefore, to determine that region of operation within which the power factor is maintained sufficiently high while the system is still capable of being regulated. Mathematical analysis of this criterion leads to following conclusions: 1) the control angle should not be allowed to decrease to below  $10^\circ$  due to maximum load changes that could be expected; 2) a reduced supply voltage results in the narrowing of the permissible range of firing angles; 3) the power factor of the system increases with the correction angle and therefore with the magnitude of the disturbance. The power is minimum at no load and is maximum at maximum load. Orig. art. has: 9 figures, 3 tables and 51 formulas.

1191. Brain Lesions in Schizophrenia. (К патологическим изменениям в мозге шизофреников) А. Д. ЗУРАБАШВИЛИ. Невропатология и Психиатрия [Neuropat. Psikihiat.] 19, No. 1, 26-31, Jan.-Feb., 1950. 5 figs., 6 refs.

Fifteen biopsy specimens obtained at leucotomy in cases of long-standing schizophrenia were studied histologically. All the specimens were of Brodmann's area 8 or the transition zone from area 8 to area 9. Small foci of nerve cell loss or rarefaction were seen in layers II, IIIa, IIIb, and to a lesser extent in IIIc. These foci were not uncommonly surrounded by a zone in which the nerve cells showed degenerative changes, chiefly with oedema. Short of the focal cell loss, described above, there were also milder lesions in the external layer complex, namely, layers IIIa, IIIb, IIIc, and II. The inner layer complex was much less involved. The changes consisted of the wrinkling and sclerosis of nerve cells together with pericellular and peridendritic oedema. The protoplasmic and dendritic processes showed tortuosity, swelling, beading, and fusion of fibrils. Only the dendrites and protoplasmic processes were affected in some of the fields while the cell bodies remained intact, and these dendritic lesions were observed to progress in a retrograde fashion towards the cell body. In places where this occurred the synaptic formations, which were present in normal form and numbers round the intact part of the neurone, were conspicuously lacking round the affected dendrites. Early pericellular oedema was associated with a shift of the synaptic structures away from the cell body. These synaptic structures themselves were coarser and more argentophilic than normal ones.

The author thinks that the primary brunt of the lesions in schizophrenia falls on the axo-dendritic synaptic apparatus. His previous studies of the electroencephalographic changes in schizophrenia had indicated a disturbance of co-ordination between the two hemispheres. Commissural fibres between homonymous

and homotopical fields in the two hemispheres, which run in the corpus callosum, originate and end chiefly in layer III. It is therefore justifiable to conclude that the changes described above form the anatomical substratum for the electroencephalographic disturbances. It is also thought that there is a disturbance in the co-ordinating connexions between the frontal lobe and the anterior nuclei of the thalamus.

Reviewer lauds the publication of this book and its criticism of such Western scientists as Sherrington and Herrick. Acc to the reviewer, the book, which is based on a strict materialistic foundation and the teachings of I.P.Pavlov and O. B. Lepishinskaya, leans strongly toward the neuron theory and discusses the pathological morphology of ganglion formations, histological methods, and the author's findings on the presence of synoptic zones in the brain and spinal cord of human beings.
