TITLE: A method for increasing the antioxidative stability of Industrial 12 petroleum lubricating oil. Class 23, No. 187914

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966, 79

TOPIC TAGS: lubricant, lubricating oil, petroleum lubricating oil, hydrocarbon lubricant, lubricant additive, antioxidant additive, oxidation inhibition, morpholine, morpholine derivative, methylmorpholine derivative, propandiol derivative, morpholinomethyl propandiol derivative

ABSTRACT: An Author Certificate has been issued for a method of increasing the antioxidative stability of Industrial-12 petroleum lubricating oil by introducing a methylmorpholine derivative as an antioxidant additive. 2,2-Bis(morpholinomethyl)-1,2-propandiol was used to widen the selection of additives. [BN]

TITLE: Designs of Medical Instruments Suitable for Production by Cold
Extrusion (Konstruirovaniye meditsinskikh instrumentov, dopus-
kayushchikh kholodnoye pressovaniye)

PERIODICAL: Materialy po obmenu opytom i nauchn. dostizh. v med. prom-
sti, 1957, Nr 4 (23), pp 90-106

ABSTRACT: The manufacture of medical instruments from blanks in the
form of bodies of revolution produced by cold reducing, cross-
rolling, or machined by template on a lathe is performed on or-
dinary presses using open plates, with reduction by 50-60 percent
in a single operation in the cold condition under unit pressures of
12-15 t/cm², offering the following advantages: replacement of
the laborious operations of hand roughing and filing by machine
operation, production of a high degree of surface finish without
burrs or having no more than a thin flash, saving of metal, em-
ployment of universal equipment, use of simple and cheap dies,
repair of which may be done on a flat grinder. When high degrees

Card 1/2

Designs of Medical Instruments Suitable for Production by Cold Extrusion

of reduction are required, the pressing is done in a number of passes, with high-temperature annealing performed between passes. Methods of calculating the initial blank and of designing the non-operating elements of the instrument, also examples of typical products manufactured in this manner, are presented.

Ed.: M. V. Storozhev; Ed. of Publishing House: A. I. Sirotin,
Engineer; Tech. Ed.: B. I. Model'; Managing Ed. for Literature
on Heavy Machine Building (Mashgiz): S. Ya. Golovin, Engineer.

PURPOSE: This book is intended for engineers and scientific workers
studying the theoretical problems of metal forming.

COVERAGE: This collective work purportedly reflects the contemporary
trends in the development of the metal-forming theory. Emphasis
is given to methods of calculating forces and deformations.

The neutral products of oxidation of petroleum hydrocarbons by atmospheric oxygen. S. S. Naumkin and V. K. Zyuzulina. *J. Gen. Chem. (U. S. S. R.)* 4, 900-14 (1934).—The oxidation of paraffin from petroleum by atm. O₂ gives, in addn. to monobasic acids and hydroxy acids, more volatile products which escape with the gases and consist of unchanged hydrocarbons, lower-boiling fatty acids and neutral substances. Condensation of this mixt. followed by removal of the acids with Na₂CO₃ gave a neutral or weakly acid oil, the aldehyde-alk. fraction (I). I, washed with Na₂CO₃ and dil. NaOH and treated with concd. NaHSO₃, gave a cryst. mass which was sepd. from unchanged oil and dissolved in water. The aq. soln. was extd. with Et₂O, decomped. with Na₂CO₃, the aldehyde layer distil. in steam, collected, dried and fractionated, giving 7.7% of mixed aldehydes (123 g. from 1600 g. I). The boiling range indicated that C₁₁H₂₀CHO to C₁₄H₂₂CHO were present. Individual aldehydes were not isolated, but an α -methylcinnamaldehyde was prep'd. from one fraction, by condensation with BaH, which closely resembled that formed from eanthaldehyde.

The residue from the NaHSO_3 ppt. was boiled 6 hrs. with NaOH soln. Distn. of the washed oil gave a 12.3% yield of alcs. based on I. A petroleum fraction gave only 0.6% of aldehydes and 1% of alcs. The crude alcs. were purified by esterification with H_3BO_3 and CaH_2 , with subsequent hydrolysis of the borates. Distn. gave fractions whose comts. corresponded roughly to each of the normal alcs. from $\text{C}_6\text{H}_5\text{OH}$ to $\text{C}_6\text{H}_5\text{OH}$. The alcs. were further characterized by oxidation to the corresponding acids and prepn. from these of the Ag salts and the amides. Aldehydes and alcs. may have been formed from acid.

hydrocarbons by a process of oxidative cracking.

TITLE: Study of the dependence of the electron absorption spectra of phenyl derivatives of elements of groups IV and V on the nuclear potentials of the elements

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 10, 1962, 2228-2230

TEXT: The effects of the nuclear potential Z^*/r and difference ΔZ in electronegativity of atoms in the element - carbon bond of isomorphic tetraphenyl compounds of C, Si, Ge, Sn, and Pb were studied. The electron absorption spectra in the region 225 - 320 μm were determined in crystalline lamellas $\sim 5\mu$ thick. Except for $(\text{C}_6\text{H}_5)_4\text{Pb}$, all spectra were

of the same type and showed two absorption bands, the first of which occurred at 250 - 280 μm owing to electron transition in the phenyl radicals from the ground state into the excited state. This band shows fine structure bands which, compared to the benzene spectrum, are shifted some μm . A noticeable shift of bands depending on the type of the

Card 1/3

S/076/62/036/010/001/005

B101/B186

Study of the dependence of the electron ...

central atom, however, does not occur. Conclusion: In tetraphenyl compounds of C, Si, Ge, Sn, and Pb, π -electron conjugation of the phenyl radicals with the central atom is almost completely absent, and the π -electron system of the benzene rings remains almost unchanged. In the second band ($\lambda \text{K} 250 \text{ m}\mu$) of $(\text{C}_6\text{H}_5)_4\text{Ge}$, the absorption edge, as compared to that of $(\text{C}_6\text{H}_5)_4\text{Si}$ and $(\text{C}_6\text{H}_5)_4\text{Sn}$, shows a shift of some $\text{m}\mu$ towards the short wave region. In accordance with H. H. Jaffe (J. Chem. Phys., 22, 1430, 1954), this effect is assumed to be caused by the central atom. The origin of the second band, however, has not been investigated sufficiently. On the basis of data obtained by Jaffe for the electron spectra of triphenyl compounds of P, As, and Sb, the phenyl radicals are assumed to conjugate owing to the free electron pairs of the central atom. Thus the shift of the first band probably depends on the type of central atom; from this shift, the change in excitation energy of π -electrons is estimated to be of the order of 0.1 ev depending on Z^*/r of P, As, and Sb. Further studies are required to explain the relation between the mobility of holes in InP, InAs, and InSb (650, 200, and 700 $\text{cm}^2/\text{v}\cdot\text{sec}$, respectively) and the ligand. There are 6 figures.

B106/B186

Electrical conductivity and...

(A)

✓

Since the compounds investigated are insulators at room temperature, the values of the electrical conductivity have been determined between 330 and 600°K. The values of the activation energy E have been calculated from the temperature dependence of σ (ascent of the straight line in diagrams $(\log \sigma, 1/T)$). Table 1 shows the results. In agreement with the data of Ref. 2, the electrical conductivity depends considerably on the nature of the metal ($Zn < Cu > Ni > Co$). The stability of the complex compounds and the electron affinity of the metals M change in the same order. The fact that the nature of the radicals bound to nitrogen atoms in the compounds X and 3 has practically no effect on the values of σ and E shows that these two quantities are mainly determined by the nature of the chemical bonds and

Card 4/6

Electrical conductivity and...

S/020/62/147/005/019/032

not by the packing of molecules in the crystal. Activation energies between 1.2 and 1.6 ev were found for the 30 compounds with the grouping M...S-C-N< investigated in Ref. 2 and in the present paper. An activation energy of this order has also been found for CuSCN, the simplest semiconductor polymer with the grouping S-C-N-. There are 2 figures and 1 table.

TITLE: More accurate calculation of gas exchange in four-cycle engines 2³

SOURCE: Dvigateli vnutrennego sgoraniya (Internal combustion engines), no. 1. Kharkov, Izd-vo Khar'k. univ., 1965, 3-10

TOPIC TAGS: engine performance characteristic, internal combustion engine, engine adjustment / ChN24/27 internal combustion engine

16
ABSTRACT: Some simplified methods for calculating the accurate equations of gas exchange proposed by Professor N. M. Glagolev (Raschet rabochego protsessa dvigateley vnutrennego sgoraniya. Uchebnoye posobiye, KhPI imen. Lenina, 1958) are discussed. These do not reduce the accuracy of the equations but facilitate the actual calculations. Two major processes are discussed: gas exchange during valve overlapping and filling process. After restating the general equations of volumetric balance derived by Glagolov (see reference above), it is suggested that the pressure equation

$$dp = [x_1 z_1 - x_2 p \sqrt{T} z_2 - x_3 p] da$$

be numerically integrated using Euler's first method. The use of other appropriate parameters in the equation is discussed, and the procedure is demonstrated by sample curves for engine ChN24/27. A simplified method for calculating the fresh charge is

Card 1/2

introduced and it is shown that this method decreases the accuracy by only $\approx 1\%$ for normal engine parameters. Orig. art. has: 22 formulas and 5 figures.

PURPOSE: This collection of articles is intended for scientific and
technical personnel concerned with machine translation and computer
technology.

COVERAGE: This collection of articles of the Institute of Precision
Mechanics and Computer Technology, Academy of Sciences USSR, is
the second in a series concerned with machine translation and
mathematical linguistics. The collection contains reports written
by members of the Machine-Translation Group of the Institute as
well as reports by researchers from other organizations. The
articles deal with various problems in machine translation, such
as the possibility of an intermediate language, relationships
between various languages, systems of recording, structure of

radiation

PERIODICAL: Kinetika i kataliz, v.3, no.4, 1962, 610-613

TEXT: A possibility was investigated of preparing metals and oxides in a finely divided form by irradiation of $Zr(OH)_4$, $Al(OH)_3$, $Fe(OH)_3$, Ni and Cu oxalates and basic copper carbonate with accelerated electrons having the energy of 0.8 Mev. The temperature of the samples during irradiation (1 to 2 g) did not exceed 40 to 50°C. Thermal decomposition at 400 to 500°C was also carried out for comparison with the irradiated materials. The decomposition of all the compounds commenced at radiation doses exceeding 10^8 rads and was intense at 10^9 to 10^{10} rads. At the latter doses the compounds were almost completely

Preparation of finely ...

decomposed. It was shown that the specific surface of the metals and oxides prepared by the irradiation method exceeds in most cases that of the samples prepared by the usual high-temperature pyrolysis. An especially marked advantage was noticed for the radiolysis of Cu and Ni oxalates. The surface area of the oxalate decomposition products consisting predominantly of metals was sometimes 10 or more times that of the decomposition products obtained by vacuum pyrolysis. Radiolysis of $Zr(OH)_4$ and $Fe(OH)_3$ gives dispersed oxides having considerable surface areas. $Al(OH)_3$ is an exception, Al_2O_3 produced by the radiolysis having a similar surface area to that of Al_2O_3 obtained by pyrolysis. The metals and oxides prepared by radiolysis may find application as low temperature catalysts and adsorbents. There are 2 figures and 2 tables.

TITLE: Telegraph broken signal regenerator designed with pulse elements

SOURCE: Elektrosvyaz', no. 8, 1966, 55-58

TOPIC TAGS: telegraph signal, telegraph equipment, signal noise separation

ABSTRACT: Known methods of pre- and post-detector filtering of a telegraph signal have secured regeneration of signals distorted up to 40% and broken up to one-half the duration of the elementary train. These methods require complicated and expensive equipment. A new signal regenerator is proposed in which the signal is evaluated on the basis of its mean value during the elementary train and which uses standard pulse devices. The regenerator can handle the breaks in radiotelegraph signal trains that lie within certain ratio of the total duration of distortions to the total duration of the elementary train. Regenerable trains are selected by means of measuring the duration of intact sections of the signals. The new method was experimentally verified with 16-element code combinations artificially distorted by statistically (near-Poisson) distributed 10-msec impulses; 10000 transmission-receptions were performed for each value of the mean noise frequency.

Structure of 4-phenyl-1,3-dihydro-1,2,4,5-tetrahydronaphthalene-2,6-dione, (I). A benzene derivative of 1,3-dihydro-1,2,4,5-tetrahydronaphthalene-2,6-dione, (II), is obtained from phenylhydrazine and (II). Compound (I) is soluble in benzene, acetone, and chloroform, and is insoluble in ether, hexane, and methanol. It decomposes at 250°C. (III) is obtained by heating (I) with 10% NaOH. The yield is 60%. (III) is soluble in benzene, acetone, and chloroform, and is insoluble in ether, hexane, and methanol. It decomposes at 250°C. (III) gives a mixture of 1,4-dicyanocyclohexadiene and 1,4-dicyanopyridine.

TITLE: Designs of Medical Instruments Suitable for Production by Cold
Extrusion (Konstruirovaniye meditsinskikh instrumentov, dopus-
kayushchikh kholodnoye pressovaniye)

PERIODICAL: Materialy po obmenu opytom i nauchn. dostizh. v med. prom-
sti, 1957, Nr 4 (23), pp 90-106

ABSTRACT: The manufacture of medical instruments from blanks in the
form of bodies of revolution produced by cold reducing, cross-
rolling, or machined by template on a lathe is performed on or-
dinary presses using open plates, with reduction by 50-60 percent
in a single operation in the cold condition under unit pressures of
12-15 t/cm², offering the following advantages: replacement of
the laborious operations of hand roughing and filing by machine
operation, production of a high degree of surface finish without
burrs or having no more than a thin flash, saving of metal, em-
ployment of universal equipment, use of simple and cheap dies,
repair of which may be done on a flat grinder. When high degrees

Card 1/2

Designs of Medical Instruments Suitable for Production by Cold Extrusion

of reduction are required, the pressing is done in a number of passes, with high-temperature annealing performed between passes. Methods of calculating the initial blank and of designing the non-operating elements of the instrument, also examples of typical products manufactured in this manner, are presented.

B-125. Utilization of Stamping Service for Experiments With Sheet Metal. B. P. Zorono. Factory Laboratories (U.S.S.R.), v. 13, July 1947, p. 879-882. (In Russian.)

The possibility of testing thin sheet metal by measurement of the energy required for punching holes and other operations on the sheet. Two instruments designed to measure this energy—the first, by deformation of a heavy spring or rubber, the second by comparison of the diameters of the impressions made by a ball on the sheet tested and on a standard specimen II ref.

The neutral products of oxidation of petroleum hydrocarbons by atmospheric oxygen. S. S. Naumkin and V. K. Zyuzulina. *J. Gen. Chem. (U. S. S. R.)* 4, 900-14 (1934).—The oxidation of paraffin from petroleum by atm. O₂ gives, in addn. to monobasic acids and hydroxy acids, more volatile products which escape with the gases and consist of unchanged hydrocarbons, lower-boiling fatty acids and neutral substances. Condensation of this mixt. followed by removal of the acids with Na₂CO₃ gave a neutral or weakly acid oil, the aldehyde-alk. fraction (I). I, washed with Na₂CO₃ and dil. NaOH and treated with concd. NaHSO₃, gave a cryst. mass which was sepd. from unchanged oil and dissolved in water. The aq. soln. was extd. with Et₂O, decomped. with Na₂CO₃, the aldehyde layer distil. in steam, collected, dried and fractionated, giving 7.7% of mixed aldehydes (123 g. from 1600 g. I). The boiling range indicated that C₁₁H₂₀CHO to C₁₄H₂₂CHO were present. Individual aldehydes were not isolated, but an α -methylcinnamaldehyde was prep'd. from one fraction, by condensation with BaH, which closely resembled that formed from eanthaldehyde.

The residue from the NaHSO_3 ppt. was boiled 6 hrs. with NaOH soln. Distn. of the leashed oil gave a 12.3% yield of ales. based on I. A petroleum fraction gave only 0.6% of aldehydes and 1% of ales. The crude ales. were purified by esterification with H_3BO_3 and CaH_2 , with subsequent hydrolysis of the borates. Distn. gave fractions whose consts. corresponded roughly to each of the normal ales. from $\text{C}_6\text{H}_5\text{OH}$ to $\text{C}_6\text{H}_5\text{OH}$. The ales. were further characterized by oxidation to the corresponding acids and prepn. from these of the Ag salts and the amides. Aldehydes and ales. may have been formed from add.

by hydrocarbons by a process of oxidative cracking.

TITLE: Study of the dependence of the electron absorption spectra of phenyl derivatives of elements of groups IV and V on the nuclear potentials of the elements

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 10, 1962, 2228-2230

TEXT: The effects of the nuclear potential Z^*/r and difference ΔZ in electronegativity of atoms in the element - carbon bond of isomorphic tetraphenyl compounds of C, Si, Ge, Sn, and Pb were studied. The electron absorption spectra in the region 225 - 320 μm were determined in crystalline lamellas $\sim 5\mu$ thick. Except for $(\text{C}_6\text{H}_5)_4\text{Pb}$, all spectra were

of the same type and showed two absorption bands, the first of which occurred at 250 - 280 μm owing to electron transition in the phenyl radicals from the ground state into the excited state. This band shows fine structure bands which, compared to the benzene spectrum, are shifted some μm . A noticeable shift of bands depending on the type of the

Card 1/3

S/076/62/036/010/001/005

B101/B186

Study of the dependence of the electron ...
central atom, however, does not occur. Conclusion: In tetraphenyl compounds of C, Si, Ge, Sn, and Pb, π -electron conjugation of the phenyl radicals with the central atom is almost completely absent, and the π -electron system of the benzene rings remains almost unchanged. In the second band ($\lambda \text{K} 250 \text{ m}\mu$) of $(\text{C}_6\text{H}_5)_4\text{Ge}$, the absorption edge, as compared to that of $(\text{C}_6\text{H}_5)_4\text{Si}$ and $(\text{C}_6\text{H}_5)_4\text{Sn}$, shows a shift of some $\text{m}\mu$ towards the short wave region. In accordance with H. H. Jaffe (J. Chem. Phys., 22, 1430, 1954), this effect is assumed to be caused by the central atom. The origin of the second band, however, has not been investigated sufficiently. On the basis of data obtained by Jaffe for the electron spectra of triphenyl compounds of P, As, and Sb, the phenyl radicals are assumed to conjugate owing to the free electron pairs of the central atom. Thus the shift of the first band probably depends on the type of central atom; from this shift, the change in excitation energy of π -electrons is estimated to be of the order of 0.1 ev depending on Z^2/r of P, As, and Sb. Further studies are required to explain the relation between the mobility of holes in InP, InAs, and InSb (650, 200, and 700 $\text{cm}^2/\text{v}\cdot\text{sec}$, respectively) and the ligand. There are 6 figures.

Electrical conductivity and...

(A)

✓

Since the compounds investigated are insulators at room temperature, the values of the electrical conductivity have been determined between 330 and 600°K. The values of the activation energy E have been calculated from the temperature dependence of σ (ascent of the straight line in diagrams $(\log \sigma, 1/T)$). Table 1 shows the results. In agreement with the data of Ref. 2, the electrical conductivity depends considerably on the nature of the metal ($Zn < Cu > Ni > Co$). The stability of the complex compounds and the electron affinity of the metals M change in the same order. The fact that the nature of the radicals bound to nitrogen atoms in the compounds X and 3 has practically no effect on the values of σ and E shows that these two quantities are mainly determined by the nature of the chemical bonds and

Card 4/6

Electrical conductivity and...

S/020/62/147/005/019/032

not by the packing of molecules in the crystal. Activation energies between 1.2 and 1.6 ev were found for the 30 compounds with the grouping M...S-C-N< investigated in Ref. 2 and in the present paper. An activation energy of this order has also been found for CuSCN, the simplest semiconductor polymer with the grouping S-C-N-. There are 2 figures and 1 table.

TITLE: More accurate calculation of gas exchange in four-cycle engines 2³

SOURCE: Dvigateli vnutrennego sgoraniya (Internal combustion engines), no. 1. Kharkov, Izd-vo Khar'k. univ., 1965, 3-10

TOPIC TAGS: engine performance characteristic, internal combustion engine, engine adjustment / ChN24/27 internal combustion engine

16
ABSTRACT: Some simplified methods for calculating the accurate equations of gas exchange proposed by Professor N. M. Glagolev (Raschet rabochego protsessa dvigateley vnutrennego sgoraniya. Uchebnoye posobiye, KhPI imen. Lenina, 1958) are discussed. These do not reduce the accuracy of the equations but facilitate the actual calculations. Two major processes are discussed: gas exchange during valve overlapping and filling process. After restating the general equations of volumetric balance derived by Glagolov (see reference above), it is suggested that the pressure equation

$$dp = [x_e z_e - x_b p \sqrt{T} z_b - x_v p] da$$

be numerically integrated using Euler's first method. The use of other appropriate parameters in the equation is discussed, and the procedure is demonstrated by sample curves for engine ChN24/27. A simplified method for calculating the fresh charge is

Card 1/2

introduced and it is shown that this method decreases the accuracy by only $\approx 1\%$ for normal engine parameters. Orig. art. has: 22 formulas and 5 figures.

PHASE I BOOK EXPLOITATION

Akademiya nauk SSSR. Institut tochnoy mekhaniki i vychislitel'noy tekhniki.

Trudy (Academy of Sciences of the USSR, Institute of Precision Mechanics and Computer Technology. Transactions) no. 2. Moscow, 1961. 447 p. 1000 copies printed. Contributors not mentioned.

PURPOSE: This collection of articles is intended for scientific and technical personnel concerned with machine translation and computer technology.

COVERAGE: This collection of articles of the Institute of Precision Mechanics and Computer Technology, Academy of Sciences USSR, is the second in a series concerned with machine translation and mathematical linguistics. The collection contains reports written by members of the Machine-Translation Group of the Institute as well as reports by researchers from other organizations. The articles deal with various problems in machine translation, such as the possibility of an intermediate language, relationships between various languages, systems of recording, structure of

algorithms, methods of independent analysis of a number of languages (Chinese, German, English, Russian, Rumanian, Swedish, Tartar, etc.), independent synthesis of the Russian language, some problems of binary Japanese-Russian and Chinese-Russian translation, theoretical translation problems, and problems associated with automatic recognition of speech elements and the introduction of written texts. No personalities are mentioned. There are 11 references: 2 Soviet and 9 English.

TITLE: Preparation of finely divided metals and oxides by
radiation

PERIODICAL: Kinetika i kataliz, v.3, no.4, 1962, 610-613

TEXT: A possibility was investigated of preparing metals and oxides in a finely divided form by irradiation of $Zr(OH)_4$, $Al(OH)_3$, $Fe(OH)_3$, Ni and Cu oxalates and basic copper carbonate with accelerated electrons having the energy of 0.8 Mev. The temperature of the samples during irradiation (1 to 2 g) did not exceed 40 to 50°C. Thermal decomposition at 400 to 500°C was also carried out for comparison with the irradiated materials. The decomposition of all the compounds commenced at radiation doses exceeding 10^8 rads and was intense at 10^9 to 10^{10} rads. At the latter doses the compounds were almost completely

decomposed. It was shown that the specific surface of the metals and oxides prepared by the irradiation method exceeds in most cases that of the samples prepared by the usual high-temperature pyrolysis. An especially marked advantage was noticed for the radiolysis of Cu and Ni oxalates. The surface area of the oxalate decomposition products consisting predominantly of metals was sometimes 10 or more times that of the decomposition products obtained by vacuum pyrolysis. Radiolysis of $Zr(OH)_4$ and $Fe(OH)_3$ gives dispersed oxides having considerable surface areas. $Al(OH)_3$ is an exception, Al_2O_3 produced by the radiolysis having a similar surface area to that of Al_2O_3 obtained by pyrolysis. The metals and oxides prepared by radiolysis may find application as low temperature catalysts and adsorbents. There are 2 figures and 2 tables.

TITLE: Telegraph broken signal regenerator designed with pulse elements

SOURCE: Elektrosvyaz', no. 8, 1966, 55-58

TOPIC TAGS: telegraph signal, telegraph equipment, signal noise separation

ABSTRACT: Known methods of pre- and post-detector filtering of a telegraph signal have secured regeneration of signals distorted up to 40% and broken up to one-half the duration of the elementary train. These methods require complicated and expensive equipment. A new signal regenerator is proposed in which the signal is evaluated on the basis of its mean value during the elementary train and which uses standard pulse devices. The regenerator can handle the breaks in radiotelegraph signal trains that lie within certain ratio of the total duration of distortions to the total duration of the elementary train. Regenerable trains are selected by means of measuring the duration of intact sections of the signals. The new method was experimentally verified with 16-element code combinations artificially distorted by statistically (near-Poisson) distributed 10-msec impulses; 10000 transmission-receptions were performed for each value of the mean noise frequency.
