"Susceptibility to Powdery Mildew of Varieties of Peas"

Moscow, Selektsiya i Semenovodstvo, Vol 36, No 6, Nov/Dec 71, pp 75-76

Abstract: Powdery mildew caused by Erysiphe communis is the most common disease of peas in Leningradskaya Oblast'. Dry and hot weather favors the development of the disease. Forty varieties of peas were subjected to tests to determine the susceptibility to powdery mildew. Methods recommended by the All Union Institute of Plant Protection were applied in estimating the degree of infection. Slow-ripening varieties were more susceptible to infection than rapidly ripening varieties or those with a medium rate of ripening, because their ripening coincided with the time of mass development of the disease. Of the forty varieties tested, three showed a low susceptibility to powdery mildew, 10 a medium susceptibility, and 27 a high susceptibility. The varieties with a low susceptibility (degree of infection of the plants on the basis of the plant area affected, 20-25%) were Afganistanskiy, Perchak, and Shirobana kinusaja, and those with a medium susceptibility (degree of infection 25-50%) Chicara, Pobeditel', Signal, Superperfection, Da Beira, Olho preto, Acclimatized Round-Seeded, Ambrosiana, Nano Taccola, and Ehgl. Sabel.

"Approximation of Complex Transfer Functions by Interpolation"

Dokl. Yubileyn. nauch.-tekhn. konferentsii Fak. avtomat. sistem. Tomsk. politekhn. in-t (Reports of the Anniversary Scientific-Technical Conference of the Faculty of System Automation of the Tomsk Polytechnic Institute), Tomsk, 1970, pp 263-268 (from Referativnyy Zhurnal -- Matematika, No 8, Aug 71, Abstract No 8B775 by I. Shelikhova)

Translation: In analog computer investigations of automatic control systems of processes with distributed parameters, complex transfer functions must be approximated by fractionally rational expressions. A method of finding the coefficients of such approximating expressions by interpolation is presented for the case of processes with distributed parameters that have monotonic or near-monotonic transfer characteristics, which are approximated by exponents with a high degree of accuracy. The increase in approximation accuracy is due to the increase in the order of the approximating expression. Results of approximating transfer functions of the lag component are discussed.

"Synthesis of Halogenated Phosphorylated Acetals of Chloral and Bromal"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 6, Jun 70, pp 1260-1262

**Abstract:** Biologically highly active esters (I) were obtained from the reaction of halogen-substituted hemiacetals of chloral and bromal with dipropyl chlorophosphite. I were prepared by mixing 0.1 g-mole of hemiacetal and 0.1 g-mole triethylamine in diethyl ether, cooling the mixture, and adding dropwise dipropyl chlorophosphite. Physical data for many such compounds are given in tabular form.

"A Device for Equalizing the Currents of Two Transistors Connected in Parallel"

USSR Author's Certificate No 283324, filed 19 Jul 68, published 7 Dec 70  
(from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6G307 P)

Translation: A device is proposed for equalizing the currents of two parallel-connected transistors operating in the switching mode. The device contains a current-equalizing reactor with two windings which are connected to one of the poles of the power supply. To improve accuracy in equalizing the currents through the transistors with simultaneous elimination of electrical losses, the free ends of the windings in the current-equalizing reactor are connected in opposition and tied to the emitters of the transistors.

"A Direct-Access Memory"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tsvarynye Znaki, No 6,  
1970, pp 37-38, patent No 262181, filed 16 Dec 68

Abstract: This Author's Certificate introduces a direct-access memory which contains a stack of accumulative matrices, a monitoring unit and a control unit. Connected to the matrix stack are the address and number channels of the memory. As a distinguishing feature of the patent, provision is made for detection and correction of malfunctions. The monitoring unit contains a checking register, a cadence pulse generator, a memory cell address counter, a malfunction coordinate selector, a unit which shapes a malfunction coordinate selector interrogation signal, a gating signal shaper, and a reset signal blocking unit. Connected to the input of the malfunction coordinate selector are the outputs of the unit which shapes the selector interrogation signal and the outputs of the number register for the memory number channel and the checking register. The corresponding inputs of the checking register are connected to the outputs of channels which are coupled to the readout amplifiers of the memory number channel and to the gating signal channel. The inputs of the reset signal blocking unit are connected to the output of the control unit and to the output of the malfunction coordinate selector. The output of the cadence pulse generator is connected to the gate selector. The output of the selector is connected to the control unit.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A CLINICO ROENTGENOLOGICAL CLASSIFICATION OF SILICOTUBERCULOSIS WHICH FOR A NUMBER OF YEARS IS HAS BEEN USED AT THE CLINIC OF THE INSTITUTE OF INDUSTRIAL HYGIENE AND OCCUPATIONAL DISEASES OF THE AMS OF THE USSR, IS OFFERED FOR DISCUSSION.

THE AUTHORS SUBDIVIDE SILICOTUBERCULOSIS INTO 2 DISTINCT GROUPS. THE FIRST INCLUDES SILICOTUBERCULOSIS WHERE THE FORM OF TUBERCULOSIS CAN BE CONDITIONALLY SPECIFIED AGAINST THE BACKGROUND OF SILICOSIS. TO THE 2D GROUP IS REFERRED THE PROCESS IN WHICH DEFINITION OF THE TUBERCULOSIS FORM AND, AT TIMES, THE STAGE OF SILICOSIS TOO APPEARS TO BE IMPOSSIBLE. THE FOLLOWING FORMS OF THE DISEASE ARE SET APART WITH REFERENCE TO THE 2D GROUP: SILICOTUBERCULOUS BRONCH ADENITIS, MICRO AND MACRONODULAR AND ALSO MASSIVE SILICOTUBERCULOSIS. MOREOVER, IT IS SUGGESTED THAT THE PRESENCE OF TUBERCULOUS INTOXICATION, CASEOUS DEGENERATION AND POSITIVE BECILLOSCOPY BE POINTED UP SEPARATELY, ALONG WITH THE ABOVE MENTIONED CONDITIONS.

"Electromodeling of Plane-Radial Problems in the Filtration of Newtonian Fluids"

V sb. Probl. gidrodinamiki i rats. razrabotki neft. mestorozhd (Problems of the Hydrodynamics and Rational Developments of Petroleum Deposits -- Collection of Works), Kazan', Kazan' Institute, 1971, pp 44-50 (from RZh-Mekhanika, No 12, Dec 71, Abstract No 12B1568)

Translation: The non-steady-state plane-radial filtration of fluids exhibiting an inertial shift gradient is discussed. The electrical analog for filtration rate and for the equation which the pressure  $p(r, t)$  satisfies is described and the corresponding similarity criteria are derived. Solved on the analog electrical model are problems with the initial condition  $p(r, 0) = p_0$ , boundary conditions  $p(r_c, t) = p_c < p_0$  and either  $p(R, t) = p_0$  or  $\partial p / \partial r = \beta$  for  $r = R$  and also problems without initial conditions under the following boundary conditions:  $p(r_c, t) = (p_0 - p_c) \cos \omega t$  and either  $p(R, t) = p_0$  or  $\partial p / \partial r = \beta$  for  $r = R$ . Solutions are represented in the form of graphs and tables. The filtration of Newtonian and non-Newtonian fluids is compared. E. V. Skvortsov.

## "On a Differential Game With Random Perturbations"

Vestn. Mosk. un-ta. Mat., mekh. (Moscow University Herald. Mathematics, Mechanics), 1972, No 6, pp 58-63 (from RZh-Kibernetika, No 5, May 73, abstract No 5V108 by the author)

Translation: A differential two-person game with zero sum is considered:

$$\dot{x} = f(t, x, w, u, v), \quad x(0) = x_0, \quad w(0) = w_0, \quad (1)$$

$$J[x_0, w_0, u, v] = M \left\{ \int_0^T \omega(t, x, w, u, v) dt + F(x(T)) \right\} / x(0) = x_0, \quad w(0) = w_0 \quad (2)$$

where  $t \in [0, T]$ ,  $x \in R^n$ ,  $w \in R^m$ ,  $u \in R^p$ ,  $v \in R^q$ ,  $M(\cdot)$  is the conditional mathematical expectation. Strategies are constructed by the players in the form  $u = u(t, x, w)$ ,  $v = v(t, x, w)$ . The functions  $f$ ,  $u$ ,  $v$  are piecewise-continuous with respect to  $t$  and satisfy the Lipschitz condition with respect to  $x$ ,  $w$ ,  $u$ ,  $v$  to equal degree, the scalar functions  $\omega$  and  $F$  are continuous;

1/2

USSR

MOLOSTVOV, V. S., Vestn. Mosk. un-ta, Mat., mekh., 1972, No 6, pp 58-63

w(t) is a purely discontinuous bounded Markov process with stepwise realizations. The strategies are called optimum if they yield a saddle point in functional (2) on the strength of system (1). Sufficient conditions of optimality of strategies are derived on the basis of the method of optimum Lyapunov functions as proposed by N. N. Krasovskiy for stochastic control problems. These conditions give an explicit form of optimum strategies for linear games with square-law payoff. In this case the additive perturbation appearing in the equations of motion is assumed to be a scalar, homogeneous Markov process with a finite number of states. Finding the optimum strategies in linear games requires solving differential equations, one of which is a matrix equation of the Riccati type. A pursuit and evasion game on a straight line is considered by way of example.

"Statistical Study of the Mechanical Properties in the Al-Zn-Mg-Cu System Using Projected-Experiment Methods"

Ordzhonikidze, IVUZ, Tsvetnaya Metallurgiya, No 5, 1973, pp 135-139

**Abstract:** The study related the mechanical properties of the Al-Zn-Mg-Cu system to the composition of the melt, containing the following weight % of metals: Zn, 7.5 and 8.5; Mg, 2.5 and 3.5; Cu, 1.5 and 2.3 and Zr, 0.1%. This resulted in 8 alloys for the first stage. The alloys prepared during the second stage had the following compositions: Zn, 8.0 and 9.5%; Mg, 1.5 and 2.5%; Cu, 1.0 and 2.0%; Zr, 0 and 0.1%; Co, 0 and 0.2%; Mn, 0. and 0.3%; Fe, 0.1 and 0.2%. The mechanical properties measured were the strength ( $\sigma_B$  in kg/mm<sup>2</sup>) and the relative extension at the rupture point ( $\delta$ , in %). Sets of equations of the form  $\sigma_B = A \pm BX_b \pm CX_c \dots NX_n$  were set up and the coefficients A - N analyzed in matrix form. The  $X_n$  is the concentration

"Expansion of the Library of Standard Procedures of the TA-1M Translator"

Tr. TsNII stroit. konstruktsiy (Works of the Scientific Research Institute of Structural Parts), 1971, vyp. 20, pp 5-7 (from RZh-Kibernetika, No 9, Sep 72, Abstract No 9V616)

Translation: A list of developed standard procedures of the TA-1M translator is presented for: 1) formation of matrices and algebraic operations on them; 2) printout of files using the alphanumeric printer; 3) exchange of files in ready-access memory with the external memory of the computer. It is noted that reference to all the developed procedures is made using the standard procedure operator  $pN(q_1, q_2, \dots, q_n)$  where N is the library number of the standard procedure, and  $q_1, q_2, \dots, q_n$  are its actual parameters in place of which the identifiers of the variables and files, the numbers and arithmetic expressions can be substituted. All of these described procedures are formulated as standard programs in the IS-2 system, and the TA-1M translator is used without auxiliary shaping subprograms. They are written on the magnetic tape of the translator library and find broad application, increasing the volume of the ready-access and external memories used, facilitating the programming process in ALGOL and reducing the solution time of the problems.

"Live Vaccine Against Tick-Borne Encephalitis. Antigenic Potency"

Moscow, Voprosy Virusologii, No 6, Nov/Dec 72, pp 703-705

Abstract: Live vaccine and inactivated formolvaccine against tick-borne encephalitis were tested on 980 individuals to determine differences in immunogenicity and to derive optimum vaccination schedules. Single live vaccination produced virus-neutralizing antibodies in 46% of the individuals, anti-hemagglutinating antibodies in 43%, and complement-fixing antibodies in 6%. With one vaccination schedule production of virus-neutralizing antibodies was 62% greater with live than with inactivated vaccine. The best vaccination schedule for live vaccine was 2 injections (1 ml; 5.5-6.7 Ig LD<sub>50</sub>) 3-5 months to 1 year apart. A pronounced booster effect was noted when individuals had 2-3 previous vaccinations by inactivated vaccine. Thus use of live tick-borne encephalitis vaccine is recommended in foci in which the population had undergone immunization by formolvaccine.

"Properties of 35BT Superconductive Alloy"

Moscow, Sverkhprovodimye al'yany i soyediny.--sbornik (Superconductive Alloys and Compounds--collection of works), "Nauka", 1972, pp 160-166 (from RZh-Radiotekhnika, No 12, Dec 72, abstract No 12D558 [résumé])

Translation: The structure, electrical resistance and thermal expansion of 35BT superconductive alloy containing titanium and small additives of zirconium in addition to 35% niobium were studied in the state after cold deformation, annealing, and also during heating. A maximum current density  $I_k = 1 \cdot 10^5$  A/cm<sup>2</sup> in a transverse magnetic field of 30,000 G/cm was reached after cold deformation and annealing at 450°C for 4 hours. Segregations of  $\alpha$ -phase with transverse dimensions of about 300 Å are observed in the structure of the alloy in this state. On the  $I_k(H)$  curve of the specimens in the state after cold deformation and after annealing at 200-300°C, a peak is observed due to the presence of  $\omega$ -phase in the alloy structure. Four illustrations, bibliography of 14 titles.

"Plastic Deformation of Fe-3% Si Single Crystals under Stress"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 29, No 4, Apr 70, pp 890-892

Abstract: An experimental study was made of slip in single crystals of Fe-3% Si. Single crystals with an orientation of (110) [001] and minimum slope of the (110) plane to the plane of the sheet from which the samples were cut ( $2-3^\circ$ ), were cut into samples measuring  $0.5 \times 13 \times 120$  mm at different angles ' $a$ ' ( $0 \leq a \leq 90^\circ$ ) to direction [001]. The samples were strained by elongation at two different rates ( $4 \times 10^{-3}$  and  $4 \times 10^{-5} \text{ sec}^{-1}$ ) to the yield point. The change in the active systems of slip (for traces of slip in two mutually perpendicular planes) and the yield point in changing orientation of the samples were analyzed.

A comparison of experimental values for the angles, formed by slip traces, with calculated angles for the same slip systems did not show complete conformance with any of the inspected systems; the experimental data were closer to the results for the system  $\{hkl\} < 111 >$ , than for planes of maximum tangential stress, but still with no conformance.

1/2

USSR

APANAS'YEV, S. V., and MOLOTOLOV, B. V., Fizika Metallov i Metallovedeniye,  
Vol 29, No 4, Apr 70, pp 890-892

Thus, slip in the Fe-3% Si alloy can be characterized by the following features:

1. Slip has a non-crystallographic character in all planes except the  $\{110\}$  plane.
2. Change in yield point can be closely described by the principle of critical shear stresses for the slip system  $\{110\} < 111 >$ .
3. The planes of slip are close to the planes of maximum tangential stress but not coincident with them.
4. Slip is asymmetrical for relatively positive and negative angles.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. AN IMPROVED METHOD OF DETERMINING THE MONOTONIC BENDING OF METALLIC LATTICES, BASED ON THE SCHULZ X RAY TOPOGRAPHICAL TECHNIQUE, IS DESCRIBED. A STRAIGHT WIRE IS STRETCHED OVER THE CRYSTAL AND THE IMAGES OF THIS WIRE FORMED BY X RAY DIFFRACTION CORRESPOND TO THE BENDING OF THE CRYSTAL PLANES. A FORMULA REPRESENTING THE RELATIONSHIP BETWEEN THE SHAPE OF THE WIRE IMAGE AND THE CURVATURE OF THE LATTICE IS DERIVED. THE FORMULA ENABLES A DISTINCTION TO BE MADE BETWEEN THE ACTUAL BENDING OF THE PLANES AND ASPERITIES ON THE CRYSTAL SURFACE.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. SINGLE CRYSTALS OF THE ALLOY FE PLUS 3.5 PERCENT SI WERE GROWN FROM A MELT WITH CRYSTN. RATE 0.12 MM PER MIN AND TEMP. GRADIENT IN SOLID PHASE 50DEGREES PER CM. THE MAGNETIC STRUCTURE WAS EXAMD. SIMULTANEOUSLY BY POWDER AND X RAY DIFFRACTION TOPOGRAPHIC TECHNIQUES. THE X RAY PHOTOGRAPHS WERE TAKEN BY THE SENSITIVE SHULZ METHOD. THERE ARE 3 KINDS OF DIFFRACTION CONTRAST: DYNAMIC (A), EXTINCTIAL (B), AND DISCRETE EXTENSION OF A CRYSTAL LATTICE (C). THE A IS THE RESULT OF A DISTORSION OF H A WAVE FIELD GENERATED IN THE "THICK" CRYSTAL (MUT APPROXIMATELY EQUAL TO 10, WHERE MU EQUALS LINEAR ABSORPTION COEFF., T EQUALS THICKNESS OF THE CRYSTAL) WHEN THE LAUE TYPE PHOTOGRAPH IS TAKEN. IT DECREASES THE INTENSITY OF THE DIFFRACTED BEAM. THE B OCCURS IN THE "THIN" CRYSTALS (MUT APPROXIMATELY EQUAL TO 1) ON THE LAUE PHOTOGRAPHS OR IN THE "THICK" CRYSTALS ON THE PHOTOGRAPHS TAKEN WITH REFLECTION (BRAGG METHOD). THE C IS A RESULT OF EXTENSION OF TWO ADJACENT REGIONS OF SIZE 10 PRIME NEGATIVE 1 MM OR LARGER. THE BORDER BETWEEN THESE REGIONS OCCURS ON A PHOTOGRAPH AS LIGHT OR DARK STREAKS. THE B IS OBSERVABLE IN THE PLACES OF GREAT DISTORTIONS ON TOPODIAGRAMS TAKEN BY SHULZ METHOD.

"Effect of A High-Temperature Heat Treatment Medium on the Structure and Magnetic Properties of Transformer Steel"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 34, No. 2,  
Feb 70, pp 262-266

**Abstract:** The refining ability of various media in high-temperature annealing in industrial dome furnaces was studied by optical microscopy methods, by measuring magnetic properties and by determining the chemical composition of transformer steel. Four different steel compositions were tested in the experiment and their concentrations of Si, C, S, N, O, Al, Mn, and H before and after annealing in a vacuum or in a hydrogen or nitrogen medium are given in tabular form. It was found that high-temperature annealing in dome vacuum and gas furnaces did not ensure the required degree of refinement of the steel from C, N, O, and S impurities. Raising the degree of evacuation under high-temperature heat treatment of the steel in the most improved industrial furnaces also had little effect in improving the refinement. It was concluded that in order to

"Mixed Surface Waves at the Boundary of a Nonuniform Elastic Medium with a Non-uniform Liquid"

Tr. Vses. simpoz. po difraktsii i rasprostr. voln, 1970 (Works of the Fifth All-Union Symposium on Wave Diffraction and Propagation, 1970), Leningrad, Nauka Press, 1971, pp 144-162 (from RZh-Mekhanika, No 11, Nov 71, Abstract No 11V114)

Translation: The solutions of the equations of motion of a nonuniform medium called mixed surface waves are isolated. The waves are propagated along the boundary of an elastic medium and a liquid and are formed as a result of interference of whisper tunnel waves and ordinary Stanley or Rayleigh surface waves. The solution is found in the form of asymptotic series with respect to powers of  $\omega^{1/3}$  ( $\omega$  is the frequency). Substitution of the series in the equations and boundary conditions leads to a system of differential equations which must be solved. The physical properties of the waves are investigated: dispersion, polarization, damping and depth of penetration. The possibility of using the method of structural interference to describe mixed surface waves near the boundaries of nonuniform media where the beam field loses its regularity is confirmed.

"Elastic Wave Propagation from a Source Applied to a Nonuniformly Broadening Circle"

V sb. Vopr. dinamich. teorii rasprostr. seismich. voln. (Problems in the Dynamic Theory of Seismic Wave Propagation-- collection of works) No. 10, Leningrad, "Nauka" 1970, pp 4-15 (from RZh-Mekhanika, No. 8, Aug 1970, Abstract No. 8V246)

Translation: A study is made of the propagation of waves in an elastic half-space under the action of a source applied to a non-uniformly widening circle. A particular case is chosen in which the radius  $r$  of the circle is proportional to  $\sqrt{t}$ . That problem is especially interesting since the field of movement is represented by only two repeated integrals. In the general case, however, the components of the movement are described by three repeated integrals; the additional integration is then made over the time preceding the observation. Since this integral is computed by asymptotic methods in the investigation of the movements, it is useful to compare the asymptotic with the accurate expressions. This paper makes such a comparison. "Synthesis of Phosphatidic Diols"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 1, Jan 71.  
pp 194-196

**Abstract:** The synthesis of phosphatidic diols (I) is based on the condensation of the silver salt of benzyl-(1-lauroyl-2-oleoyl-sn-glyceryl) phosphate with trityl ethers of glycol iodohydrines. Removal of the benzyl group from the thiophosphates with sodium iodide in acetone followed by removal of the trityl group by acid hydrolysis yielded 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylethylene glycol, 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylpropanediol, and 1-lauroyl-2-oleoyl-sn-glycero-3-phosphorylbutanediol. The phosphatidic diols obtained are soluble in most common organic solvents and can be stored in the form of calcium salts.

"Development of the Concept of Slip in the Theory of Plasticity"

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 2, 1973, pp 4-11

Abstract: The plastic deformation of a body, the volume of which does not change in the process of this deformation, is determined via the intensity of movements (local slips) of the linear distortions taking place along a set (fan) of planes and directions of slip. A study is made of "semisimple" loading, when the sign of the stresses changes only once. The deformation of plastic materials which have a yield platform is described for the first time on the basis of the slip concept. 3 figures. 12 references.

## "Interaction of Silver Atoms on the Surface of a Halide"

V sb. Mezhdunar. kongress po fotogr. nauke, Moskva, 1970, Priroda fotogr. chuvstvitel'nosti (International Congress on Photographic Science, Moscow, 1970, Nature of Photographic Sensitivity -- Collection of Works), no place of publication given, Vneshtorgizdat, no year given, pp. 143-146 (from RMF-Fizika, No 12(I), Dec 70, Abstract No 12D1366)

Translation: On the assumption that a chemisorbed Ag<sup>+</sup> atom on the surface of AgBr forms the quasimolecule Ag<sub>2</sub><sup>+</sup>, with the closest Ag<sup>+</sup> ion of the lattice in the field of the remaining ions, the position of the local level of this atom is calculated. The values obtained for the thermal and optical ionization from this level into the 0.804 and 1.246 ev conductivity bands were close to experimental data on the thermal decay energy of the first atom of the Ag-center (in terms of isoopacities) and on the long-wave boundary of the Herschel effect. The adsorption of Ag<sub>2</sub><sup>+</sup> molecules with the formation of a stable Ag<sub>3</sub><sup>+</sup> quasimolecule

MOLOTSKIY, M. I., LATYSHEV, A. N., Mezhdunar. kongress po fotogr. nauke, Moskva, 1970, Priroda fotogr. chuvstvitel'nosti, no place of publication given, Vnesh-torgizdat, no year given, pp 143-146.

and the adsorption of a linear  $\text{Ag}_3$  molecule transforming into triangular  $\text{Ag}_4^+$  and forming a tetrahedron is considered under the same assumption. The interaction of two Ag atoms on the surface is considered as the rise (due to exchange forces) and the repulsion of two parallel dipoles; it is shown that the formation of an  $\text{Ag}_2$  molecule from these on a smooth surface is possible despite the energy barrier caused by their interaction with the lattice. A similar analysis for the Ag atom and the  $\text{Ag}^+$  ion showed that the  $\text{AgAg}^+$  complex forms only on a stepped surface and not on a smooth surface; on the [111] edge of this complex there is a considerably deeper electron shower than on the [100] edge, in agreement with experimental data showing higher sensitivity of octahedral microcrystals than of cubic crystals. "The Static and Dynamic Distribution of Sevin in the Environment"

Moscow, Gigiyena i Sanitariya, No 2, Feb 73, pp 24-28

Abstract: Upon treatment with 1.36 kg/ha of 85% wettable sevin powder of 1 ha of an apple orchard at 20-21° and a wind velocity of 1.5 m/sec, experimental data were obtained which were used in the derivation of mathematical relations that describe the static and dynamic distribution of sevin or of a similar insecticide in the environment. The relation between the concentration C on vegetation located at a distance S from the objects treated, on which the concentration was  $C_r$ , could be described by the equation  $C/C_r = -0.065 + 0.67 \times 1/S \times 10^2$ . The dynamics of changes of the concentration of sevin in the air, on the ground and at plant surfaces, and in the apples were determined. The dynamics of disappearance of sevin from the surface layer of soil and from the apples could be described by exponential equations, on the basis of which the time required for the disappearance of the insecticide could be calculated. The concentration  $C_a$

1/2

USSR

IVANOVA, L. N., and MOLOZHANOVA, Ye. G., Gigiyena i Sanitariya, No 2, Feb 73,  
pp 24-28

of sevin in the air adjacent to the soil varied in relation to its concentration  $C_a$  in the soil, the temperature  $T$ , and the velocity  $V$  of air motion according to the equation  $C_a/C_s = -0.14 + 0.126 \sqrt{T/V}$ . It followed from this equation that in the southern regions of the USSR in hot ( $T = 38^\circ$ ) and windless weather the maximum permissible concentration of sevin in the air ( $1 \text{ mg/m}^3$ ) would be exceeded during the first 12 days after application of this insecticide. According to the relations derived, sevin would disappear from the apples after 34 days. This corresponds pretty closely to the 30 days after application of sevin at the expiration of which fruit are normally harvested.

"Use of Mathematical Analysis in Modeling the Behavior of Sevire in the Soil"

V sb. Gigiyena primeneniya, toksikol. pestitsidov i klinika otravl. (Pesticides -- Safety Measures in Using, Toxicology, and the Poison Clinic--collection of works), vyp. 9, Kiev, 1971, pp 77-83 (from RZh-Khimiya, No 7, Apr 72, Abstract No 7N750)

Translation: A piecewise approximation is found for the dissolution curve of sevire in 6 kinds of soil typical of the central territory of the USSR under laboratory conditions with concentrations of 0.5-10 mg/kg of sevire in the soil. In the interval up to 15 days, the dissolution curve takes the form  $10^{a+bt}$  where a is the decimal logarithm of the initial concentration, t is time and b ranges from -0.114 to -0.046 depending on the type of soil. In the interval from 15 to 45 days, the dissolution curve becomes a straight line with a slope equal to the rate of dissolution on the 15th day. As the dose is decreased, the initial rate of dissolution of sevire increases. The proposed model does not have sufficient precision for describing dissolution of sevire under natural conditions since it does not account for climatic conditions, the type of cover crop and other factors. "On the Effect of Plastic Deformation Under Biaxial Stretching at Liquid Nitro-  
gen Temperatures on the Structure and Properties of 1Kh18N10T Steel"

Moscow, Izvestiya vysshikh uchebnykh zavedeniy, Mashinostroyeniye, No. 12,  
1971, pp 105-109

**Abstract:** The plastic deformation was determined and the structure and mechanical properties of 1Kh18N10T steel were studied. The steel was intended for the fabrication of vessels and various welded reservoirs operating under conditions of biaxial stretching at low temperatures. It is noted that austenite stainless steels are very important structural materials in cryogenic technology and a basic feature of their behavior under deep cooling is a rise in strength while maintaining sufficient plasticity. Experimental data was available on the mechanical properties of many steels of the austenite class under axial

1/2

USSR

SIDORIN, I. I., et al, Izvestiya vysshikh uchebnykh zavedeniy, Mashinostroyeniye, No. 12, 1971, pp 105-109

stretching at low temperatures, but there has not been data for biaxial stretching and therefore the effect of plastic deformation under conditions of biaxial stretching on the structure and properties of samples of 1Kh18N10T steel were studied at liquid nitrogen temperatures. Comparison of the results obtained under biaxial stretching conditions with published data for uniaxial stretching shows that the martensite is considerably greater than under uniaxial stretching conducted at a temperature of -196°C. This is in good agreement with the results of strength tests showing a considerably greater effect of strengthening under biaxial stretching than under axial stretching. At a temperature of 20°C both biaxial and uniaxial stretching did not lead to a considerable formation of martensite. It is concluded that the transformation of austenite into martensite under biaxial stretching of 1Kh18N10T steel at liquid nitrogen temperatures occurs considerably more intensively than under uniaxial stretching. This is attributed to the greater intensity of strengthening of the steel under biaxial stretching under low temperature conditions than under uniaxial stretching.

Leningrad, Zhurnal Obshchey Khimii, Vol 41 (103), No 2, Feb 71, pp 318-319

Abstract: The reaction of tris-dimethylamidophosphite, methyl bis-dimethylamidophosphonite, and dialkyldialkylamidophosphinate with the azides of carbonic acid esters yields corresponding alkyl esters of phosphazocarbonic acids. To a solution of 0.1 g-mole of the azide of carbonic ester in 20 ml of absolute ether, 0.1 g-mole of the respective phosphite, phosphonite in 20 ml of solvent is added dropwise. The reaction is exothermic. After the addition is completed, the mixture is heated for 30 min, the solvent is removed and the product is distilled under vacuum.

*"Tetraisocyanato- $\rho$ -phenylene Diphosphite and Its Derivatives"*

Leningrad, Zhurnal Obshchey Khimii, Vol XLIII (CV), No 1, 1973, pp 29-32

Abstract: Heretofore, only the synthesis of tetraisocyanatodiphosphine with a yield of 5% [M. Baudler, et al., Z. Naturforsch., No 20b, 494, 1965] and 3,9-diisocyanato-2,4,8,10-tetraoxy-3,9-diphosphaspiro-5,5)-undecane, its dioxides, mono and dithioxides [P. M. Pivawer, et al., J. Heterocyclic Chem., No 4, 599, 1967] has been described. On interaction of tetrachloro-n-phenylene diphosphite with sodium cyanate, tetraisocyanato- $\rho$ -phenylene diphosphite is formed. The tetraisocyanato-n-phenylene diphosphite is easily oxidized by nitrogen oxides into tetraisocyanato-n-phenylene diphosphate, and on reacting with phosphorus thioxychlorids, it is converted into tetraisocyanato-n-phenylene phosphitophosphonophosphate or tetraisocyanato- $\rho$ -phenylene-bis-thionphosphate. On storing tetraisocyanato-n-phenylene diphosphite and phosphate, they polymerize, apparently, with the formation of uretidine dionic rings. The tetraisocyanates reacting easily with alcohols and amines with the formation of the corresponding urethanes and ureas.

"Alkyl Esters of Alkyldialkoxyphosphazocarbonic Acid"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 5, May 70, pp 998-  
1001

Abstract: Dialkyl phosphonites react with amides of alkyl esters of carbonic acid to give alkyl esters of alkyldialkoxyphosphazocarbonic acid. Heating of alkyl esters of alkyldimethoxyphosphazocarbonic acid ( $120-140^{\circ}$ , 3-5 hrs) gives methyl esters of N-methylalkylurethan-methylphosphonic acid, with a side reaction resulting in the formation of dimethyl phosphonates. The structure of the resultant compounds was confirmed by IR spectra.

A70-23143 Experimental investigation of the characteristics of two-dimensionally periodic slow-wave structures (Eksperimental'noe issledovanie kharakteristik dvumernoperiodicheskikh zamedliaiushchikh sistem). A. G. Shein, V. I. Mol'yavko and G. Ia. Krasovsky (Kharkovskii Institut Radioelektroniki, Kharkov, Ukrainian SSR). Radiofizika, vol. 13, no. 1, 1970, p. 152-154. In Russian.

Experimental verification of Shein's (1968) theoretical study of the characteristics of a two-dimensionally periodic slow-wave structure. It is found that Shein's formulas, derived in zero approximation, accounting only for the first harmonic are, in general, in satisfactory agreement with the experimental data. A certain increase in the error at the band boundaries is attributed to an augmented influence of the higher spatial harmonics on the structure of the hf field.

*M*  
"A Method for the Numerical Solution of Hyperbolic Equations"Alma-Ata, Vestnik Akademii Nauk Kazakhskoy SSR, No 3, Mar 1970,  
pp 61-63

Abstract: The following problem is considered in the region (1)  
 $0 \leq x \leq a, 0 \leq y \leq b: U_{xy} = A(U, x, y)U_x + B(U, x, y)U_y + C(U, x, y),$

$$U|_{y=0} = \varphi(x); U|_{x=0} = \psi(y), \quad (2)$$

where  $\varphi(0) = \psi(0)$ . The solution of problem (1), (2) satisfied the integro-differential equation

$$U(x, y) = \varphi(x) + \psi(y) - \varphi(0) + \int_0^x \int_0^y (AU_t + BU_s + C) ds dt. \quad (3)$$

Since the analytical solution of equation (3) involves many mathematical difficulties, the following is a method for the numerical

1/3

USSR

BORODIKHIN, R. G., et al, Vestnik Akademii Nauk Kazakhskoy SSR,  
No 3, Mar 1970, pp 61-63

solution of equation (3) which can be easily carried out on computers of the "static electrointegrator" type. The continuous region D of the "static electrointegrator" type. The continuous region D is replaced by a discrete region D' with nodes  $x_{i+1} = x_i + \Delta x$  and  $y_{j+1} = y_j + \Delta y$ , where  $\Delta x = \Delta y = h$ . The values of the function at the intersection are denoted by:  $U(x_i, y_j) = U_i^j$ ,  $U(x_{i+1}, y_j) = U_{i+1}^j$ , and  $U(x_{i+1}, y_{j+1}) = U_{i+1}^{j+1}$ . Equation (3) in the region D' is written in the form

$$U_{i+1}^{j+1} = U_{i+1}^j + U_i^{j+1} - U_i^j + \iint_{\omega} [AU_t + BU_y + C] dz dy, \quad (4)$$

where

$$\omega = \begin{cases} x_i < z < x_{i+1} \\ y_j < y < y_{j+1} \end{cases}$$

- 52 -

USSR

BORODIKHIN, R. G., et al, Vestnik Akademii Nauk Kazakhskoy SSR, No 3,  
Mar 1970, pp 61-63

To determine the function  $U_{i+1}^{j+1}$  from equation (4) it is sufficient to know its values at neighboring intersections of the grid and to calculate the integral over the region  $\omega$  by some approximation method. The calculations should begin from the line of initial values, shifting successively from one grid point to another over the entire region  $D'$ . The distinguishing feature of this method is that an integral that is a much smoother function than the integrand is approximated; it is possible to limit oneself to a small number of grid points and still obtain a sufficiently good approximation. An example is given.

"Semiconductor Laser Diode as a Modulator of Gas Laser Emission"

Moscow, Kvantovaya Elektronika, Sbornik Statey, No 2(8), 1972,  
pp 96-98

**Abstract:** Experimental proof is given for the feasibility of modulating gas laser emission by using a semiconductor laser diode with simultaneous amplification of the power of the modulated emission. Argon-oxygen gas laser pulse emission was modulated by a gallium arsenide diode with both coated and uncoated optical faces. The power of the emission passed through the diode increased in the pulse by a factor of 7-10 (pure amplification). Heating of the active region of the diode leads to distortion of the vertex of the modulated pulse. Estimates are made of the limitations on pulse duration due to this effect. One illustration, bibliography of ten titles.

"Interaction of Polyester Urethanes With Physiologically Active Media"

Moscow, Vysokomolekulyarnyye Soyedineniya, Vol 12, Seriea A, No 9, Sep 70,  
pp 2,051-2,056

**Abstract:** Polyester urethane film nets with and without a filler were studied to determine the feasibility of using these materials in gastroenteritic implants. The films were based on polydiethylene glycol adipinate, toluylene diisocyanate, hemamethylene diisocyanate or diphenylmethane diisocyanate. The cross linking agent was trimethylolpropane, and the filler was ordinary sugar or starch in quantities of 20% by weight. It was found that after subcutaneous implantation of polyester urethane, as well as after standing in gastric juice for three months, destruction of the material begins, the mechanism of destruction being the same in both instances: dissociation of both the urethane group and the ester bonds. Pepsin is absorbed by the surface of the implant, resulting in a loss of activity of the enzyme solution. At the same time, it is shown that pepsin can be desorbed from the polyester urethane.

surface under certain conditions. Specimens are more rapidly "dissolved" in physiologically active media if sugar is introduced as a filler in the implant.

"Transistor-Transistor Logic Circuit"

USSR Authors' Certificate No 314307, Cl. H 03 k 19/08, filed 26 Feb 70, published 26 Oct 71 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 5, May 72, Abstract No 5B137P)

Translation: There are well-known devices which contain an input multiemitter transistor (T) connected by the collector to the base of an intermediate T, whose collector and emitter are connected to the bases of two output series-connected Ts. The logic circuit described differs from these in that it contains a complementary T connected by its collector to the emitter of the intermediate T, by its emitter to the collector of the input T, and by its base through the resistor to the base of the input T. This makes it possible to increase the operating speed of the device.

## REMOVAL OF MERCURY FROM WASTE WATER BY SILICON OXYHYDRIDE

UDC 528.592.602.632.2

[Article by G. P. Myshkovich, V. Ya. Momot,<sup>1</sup> N.<sup>2</sup>  
and L. A. Efremova, V. V. Tikhonov, I. I. Stryemoi,<sup>3</sup> Yu. A. Parasenko,<sup>4</sup>  
submitted to Priroda, 13 December 1973. pp. 32-37]  
10 0 6 1 2 8 2 5

In producing chlorine and alkalis by the mercury method, the waste water contains a considerable amount of mercury in metallic form, in the form of insolubility compounds, and in ion form.

The only method of removing mercury from waste water that is presently used in the technology of producing chlorine and alkalis is sulfide treatment, based on the interaction of divalent mercury and the sulfide ion [1]. The removal by filtration or clarification, in addition, where there is insufficient sulfur sulfide, there is incomplete bonding of the ion mercury; where there is too much, an insoluble complex  $Hg_2S$  is formed. The use of other methods of cleansing waste water [2 - 7] is restricted by the capability of extracting only the ion form of mercury. For this reason, searches represent an important and urgent scientific-technical problem.

The promising method for cleansing waste water of mercury appears to be the use of a silicon water-containing adsorbent [8], a silicon oxyhydride ( $SiO_2/H_2O$ ). When the silicon oxyhydride comes in contact with solutions that contain ion mercury, there occurs on its surface a reduction of the ions to the metallic state. The reduced metallic mercury settles on the surface of the sorbent and sticks to its pores because of dispersion forces.

The study gives experimental data concerning the removal of mercury from waste water that comes from the production of sodium hydroxide using the mercury method; the experiments utilize the adsorption-reduction method by silicon oxyhydride. For the investigation, the fraction 3-0.5 mm silicon oxyhydride was used, obtained by procedures described in [9]. The total volume content of the pores of the silicon oxyhydride that was obtained,

"Removal of Mercury From Polluted Water by Silicon Oxyhydride"

Kiev, Khimicheskaya Tekhnologiya, No 6, Nov/Dec 73, pp 50-52

**Abstract:** The compound  $(H_2Si_2O_3)_N$  is proposed as an absorbent. The  $Hg$  ion in solution is reduced to the metal on the surface of the  $(H_2Si_2O_3)_N$  where it is fixed. A table gives the amount of  $Hg$  removed under various conditions. The amount of  $Hg$  removed is 99% for every case except the high  $Hg$  concentration (4000 mg). In another set of experiments the concentration of  $Hg$  was reduced 40 to 85 times at a pumping rate of 4 to 6 l/hr over 1 kg of absorbent.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. WEIGHT LOSS MEASUREMENTS AND POLARIZATION TESTS WERE USED TO STUDY THE INHIBITIVE ACTION OF 2(N,N,DIMETHYL,P,AZOANILINE),4,CARBOXYTHIAZOLE ON ARMCO FE AND C STEELS (CONTG. C 0.06-0.12, 0.09-0.15, AND 0.14-0.22PERCENT, RESP.) IN HCL AND H SUB2 SO SUB4. THE COMPOUND HAS A SOLUBILITY IN WATER OF SIMILAR TO 0.02 G-100 G AT 250GREESC. THE PROTECTIVE ACTION INCREASES WITH C CONTENT OF THE STEEL AND WITH INCREASING ACIDITY AND FALLS SLIGHTLY WITH RISING TEMP. FOR EXAMPLE, IN 5 N-H SUB2 SO SUB4 AND 5 N-HCL SIMILAR TO 87PERCENT PROTECTION IS OBTAINED WITH ST. 3. IT HAS LITTLE EFFECT ON THE CATHODIC REACTION AND GIVES INCREASED ANODIC POLARIZATION.

IMPROVEMENT OF DISPENSARY CARE (A RESPONSE TO THE ARTICLE BY L.A.

MAURER ENTITLED "MEANS OF IMPROVING DISPENSARY CARE IN A THERAPEUTIC DISTRICT")

(Article by B. S. Monakov, candidate of medical sciences, and Yu. I. Byblyakov  
(Author): Moscow, Sovetskaya Zdorov'ye, No 7, 1971, submitted  
5 February 1971, pp 35-36)

A considerable number of works [I.B. Rototsky, 1954; K. N. Haystrukh, 1955; S.I. Freidin, 1961; I.P. Sogolov, 1966] deals with development and improvement of the dispensary method. Nevertheless, as properly pointed out by L.R. Mauro, there are still several unsolved organizational problems. We agree with the author that it is necessary to introduce a medical log [booklet] for specific groups of individuals under dispensary observation. This would definitely improve the quality of physical examinations. It would provide rational vocational guidance, etc. Also of interest is the author's position with respect to evaluation of the effectiveness of dispensary care supported by expert methods. Many interesting thoughts are voiced in the article about the paper work on dispensary patients (insert or the outpatient chart, episilis scheme, etc) and about the effectiveness of health education.

It is common knowledge that the dispensary method includes a system of measures, including active detection of sick cases, taking specific population groups and patients with certain nosological forms of pathology under systematic dispensary care, prompt initiation of therapeutic and prophylactic measures for speedy recovery of health and ability to work, normalization of the environment, of industrial and living conditions and improvement thereof.

Unfortunately, with reference to the means of improving dispensary care in the therapeutic district L.A. Maurer discusses only organization of preventive examinations. Such an approach to the issue at hand causes one to question many positions voiced in the article. First of all, the author states that much is unclear in dispensary care because of the "inadequacy of unified methodological supervision." The idea is absolutely valid, but what solution does the author find? To have the therapist perform complex medical examinations and call upon consultants only when

"Computer Complex"

USSR Authors' Certificate No 308430, Cl. G 06 f 15/16, filed 20 Apr 70,  
published 12 Aug 71 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya  
Tekhnika, No 5, May 72, Abstract No 5B95P)

Translation: Special-purpose computer complexes are known which contain a set of digital computers with interlinking units, with synchronization of series of machines and coupling lines between the digital computers of the complex, which assure correction of data errors occurring as a result of machine malfunctions. However, the amount of time and hardware redundancy used for increasing reliability and for organization of input data averagings in these complexes is considerable. In addition, parallel operation of the machines of the set is impossible in the event that it is necessary to raise the productivity of the computer complex by lowering its reliability. The unique feature of the proposed special-purpose complex is that the output data, address, and control information function into which each computer of the complex is divided into two or more parallel working via assembly circuits into data, address, and control information, which are connected to the inputs of the

OV, V. M., et al., USSR Authors' Certificate No 308420

tersectional coupling units of all machines of the set; the output data, address, and control lines of the intersectional coupling unit of each machine of the complex are connected to the data, address, and control inputs of the functional sections of the corresponding computer of the complex. Another unique feature of the special-purpose computer complex is the fact that the intersectional coupling unit of each machine of the complex contains "m" out of "n" (where  $n > m$ ) majority circuits, majorizing inhibit gates, by-pass gates, assembly circuits, and a control register with a control signal generating circuit: the mainline of each machine of the complex being connected to the majority circuit input, through the majorizing inhibit gate to the first assembly input, and through the by-pass gate to the additional assembly input, the control inputs of the gates coupled by control lines to the corresponding outputs of the control circuit, which is connected to the control register output. This makes it possible to reduce the time and hardware redundancy for increasing reliability, provide averaging of input data, and organize parallel operation of the machines of the complex.

"Spacial-Temporal Systems of Connections Between Evoked Activities in Condi-  
tioned Reactions in Man"

Moscow, Zhurnal Vysshay Nervnoy Deyatel'nosti imeni I. P. Pavlov, Vol 23, No 2,  
Mar/Apr 73, pp 366-374

Abstract: The feasibility of investigating complex forms of conditioned activ-  
ity according to the principle of systemic organization of electrical activity  
in the human brain is analyzed. Determinations of correlation connections (Cc)  
between evoked activities in different functional cortical areas during elabor-  
ation of a trace motor conditioned reflex (stimulation with light followed  
by verbal confirmation) revealed generation of high Cc between motor and visual  
areas at the beginning and at the end of the trace pause and a marked decrease  
in Cc in the middle of the pause. By means of a special computer algorithm,  
models of spatial-temporal systems were designed for Cc forming between the  
different cortical areas during the action of a non-signal stimulus and trace  
conditioning with a 5-sec delay. In this system, principal Cc exist between  
background activity and evoked activity in the first second after stimulation.

USSR

MONAKHOV, K. K., et al., Zhurnal Vysshoy Nervnoy Deyatel'nosti imeni I. P. Pavlova, Vol. 23, No 2, Mar/Apr 73, pp 366-374

During conditioned activity, a Cc system is formed throughout the whole trace pause, with especially pronounced Cc appearing in the first and fifth second. When such a system is formed, motor reactions appear. The model is considered useful for defining systemic cerebral activity and the participation of individual functional areas.

ABSTRACT/EXTRACT—(U) GP-0— ABSTRACT. THE AUTHORS REPORT OF A STUDY CONCERNING COMPARATIVE INVESTIGATIONS OF NORMALS AND SCHIZOPHRENIC MALE PATIENTS FROM THE AGE OF 20-40. THE REGISTRATION OF ELECTRIC ACTIVITY OF PARIETAL AND OCCIPITAL BRAIN AREAS WAS CONDUCTED BY THE METHOD OF SUPERPOSITION BY PHOTO STIMULATION. THE RESULTS WERE PROCESSED BY A COMPUTER ACCORDING TO A PROGRAM OF MUTUAL CORRELATIONS OF INSTANT SIGNIFICANCE OF BIOPOTENTIALS FROM 2 AREAS. COMPARING THE COEFFICIENTS OF CORRELATIONS WITH THE MORPHOLOGY OF THE ELECTRIC CURVES OF THESE AREAS IN NORMALS IT WAS DISPLAYED THAT THE HIGHEST CORRELATION OF INSTANT SIGNIFICANCES OF THE BIOPOTENTIALS COINCIDES WITH THE PHASE OF DEVELOPMENT OF THE FIRST NEGATIVE, POSITIVE AND THE SECOND NEGATIVE WAVE. THE COEFFICIENT WAS LESS ON THE APEX AND FALL OF THE WAVE. ON THE BASIS OF ACHIEVED RESULTS THE AUTHORS PRESUME THAT THERE MAY EXIST A SPECIFIC PROGRAM IN THE DEVELOPMENT OF ELECTRIC RESPONSES, EXERTING A SUCCESSIONAL INVOLVEMENT OF DIFFERENT FUNCTIONAL STRUCTURES, WHICH FORM THE RESPONSE. IN SCHIZOPHRENIC PATIENTS WITH DIFFERENT FORMS THE PROGRAM IN THE DEVELOPMENT OF THE EVOKED RESPONSE IS DISTORTED. THE AUTHORS BELIEVE THAT THIS IS A REFLECTION OF THE DISORDERS IN THE INTEGRATIVE ACTIVITY OF THE BRAIN IN GENERAL IN SCHIZOPHRENIC PATIENTS. THE CONVENED THERAPY IN SUCH CASES DID NOT BRING ON A NORMALIZATION OF THESE PROCESSES.
