"Superconductivity and Residual Resistance of Titanium Carbide"

Moscow, Izvestiya Akademii nauk SSSR, Neorganicheskiye materialy, Vol 7, No 10, Oct 71, pp 1743-1747

Abstract: The study concerns the electric conductivity and Hall effect of titanium carbide in its homogeneity region at below-zero temperatures as well as its transition to the superconductive state in strong magnetic fields. The experimental titanium carbide was of the composition $Ti_{0.91} - Ti_{0.46}$. The study revealed a very weak temperature dependence of the conductivity at 300-4.2°K, indicating that the specific resistance at room temperature is almost completely governed by residual resistance. Both the resistance and the Hall coefficient decrease with the carbon content in the TiC_x phases. With a sufficiently high concentration of carbon defects, the increase in the density of states near the Fermi level makes possible the appearance of a superconducting gap in the energy spectrum

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE EARLIER STUDIES OF THE IR ABSORPTION SPECTRA OF THE VAPOR OVER B SUB2 O SUB3 IN AN INERT ATM. AND IN THE PRESENCE OF WATER VAPOR LEAD TO THE CONCLUSION THAT THE OBSO. BANDS IN THE SPECTRA (535, 740, 1320, AND 2030 CM PRIME NEGATIVE1) BELONG TO B SUB2 O SUB3 VAPOR AND THAT ITS MOL. HAS THE V SHAPE STRUCTURE WITH C SUB2V SYMMETRY. THIS CONCLUSION WAS CHALLENGED BY P. L. HANST, ET AL. (1965). TO CLARIFY THIS CONTRADICTION, NEW MEASUREMENTS OF THE IR ABSORPTION SPECTRA OVER B SUB2 O SUB3 WERE MADE IN THE 350-3900 CM PRIME NEGATIVE1 REGION AT SIMILAR TO 1350-1600DEGREES IN DRY AR (5-20 TORR). THE SAMPLE OF B SUB2 O SUB3 WAS PRELIMINARILY DEHYDRATED AND DEGASED AT 1000-1600DEGREES. THE NEW EXPTS. CONFIRMED THAT THE BANDS AT 2035, 1320, AND 760 CM PRIME NEGATIVE1 BELONG TO B SUB2 O SUB3 AND ITS MOL. HAS THE V SHAPE CONFIGURATION WITH C SUB2V SYMMETRY.

"Shortening the Switching Time of an Optical Transparency on a Liquid Crystal"

Moscow, Kvant. elektronika (Quantum Electronics), No 3, "Sov. radio", 1972, pp 81-83 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 1, Jan 73, abstract No 1B438 by T. V.)

Translation: A transparency on a liquid crystal controlled by an electric field is used for data recording. Scattering of the light flux with turbulent motion of the domains of the liquid crystal by sections of the transparency to which the electric field is applied leads to loss of coherence of the transmitted light and a sharp attenuation of its intensity. The pattern of electric voltages recorded on the transparency is thus transformed to an optical image which is transferred as a hologram to a photographic plate, using a laser. The frequency characteristics of dynamic scattering are studied for activation and deactivation. As a result of studying the influence which an alternating electric field and short field pulses have on scattering duration, an image recording cycle time of less than 1.2 ms is achieved. Three illustrations, bibliography of six titles.

"On the Question of Generating a Stabilized, Ring-Resonator Laser Frequency"

Moscow, Doklady Akademii Nauk SSSR, Vol 210, No 2, 1973, pp 306-308

Abstract: The power resonances of a ring laser can be considerably narrower and more contrasting than in the case of a linear laser. They are based on more complex effects, and the coincidence of the center of the resonances with the central absorption frequency is not obvious. The article studies this question theoretically and experimentally. It is shown that, as in the case of a linear laser, the power resonances of a ring laser occur at the central frequency of the absorbing gas.

"Spectroscopy Inside a Uniform (Radiation) Line"

Moscow, Doklady Akademii Nauk SSSR, vol 207, No 6, 1972, pp 1306-1307

Abstract: A method is proposed and realized for finding the shift, 2Δ , between the spectral components of a line in the radiation of atoms or molecules, and in such cases when the 2Δ value is much less than the uniform or radiation width. The method is based on the concurrence of spatial and frequency attenuation effects of the medium in a ring laser. The dependence of the qualitatively different oscillation modes of the laser on the frequency difference Δ permits recording the presence of the Doppler broadening of the line for Δ by an amount much less than for the uniform width. It is found that, from the viewpoint of the accepted criterion of spectral line resolution, the sensitivity of the proposed method can be multiplied by 10^2 - 10^4 times. The theory of the method is developed, and an experiment for resolving the fine

"Phase Modulation of Coherent Light by Means of Liquid Crystals"

Moscow, Pis'ma v Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 15,
No 4, 20 Feb 72, pp 200-203

Abstract: The article describes results of a study of the effect of phase modulation with an electric field of coherent light passing through a nematic liquid crystal with positive anisotropy of permittivity ($\epsilon_{\parallel} > \epsilon_{\perp}$). Such modulation opens up the possibility of the use of thin transparent layers of liquid crystals in controlled phase transparencies and permits an increase in optical data processing speed as compared to the speed of other liquid-crystal light switches. Phase changes in the light passing through the liquid crystal were recorded by observing the interference of light reflected by a rear and a front electrode. 4'-ethoxybenzylidene-4-aminobenzonitrile was used as the liquid crystal.

"Pulsed Semiconductor Laser Used as a High-Resolution Spectroscope"

Leningrad, Optika i Spektroskopiya, No. 3, Mar 71, pp 509-510

Abstract: A method is proposed for graduating a pulsed laser-spectroscope in the optical range with the aid of a Fabry-Perot interferometer. It is pointed out that a unique combination of properties of semiconductor lasers make them promising for high-resolution spectroscopy. The radiation of semiconductor lasers covers a wide spectral range due to a large selection of materials, and any semiconductor laser evenly retunes its frequency with a change in temperature or pressure within the limits permissible for lasers of other types. Also, the line width of a semiconductor laser is sufficiently small; for example, the ratio $\Delta\nu/\nu = 10^{-9}$, where $\Delta\nu$ is the line width and ν is the basic frequency, for injection lasers of GaAs and $Pb_{0.88}Sn_{0.12}Te$. In this work a pulsed GaAs scanning semiconductor laser was used to observe absorption at the resonance absorption line in cesium-133. The nature in the change of the length of the genera-

1/2

BYKOVSKIY, Yu. A., et al, Optika i spektroskopiya, No. 3, Mar 71, pp 508-510

tion wave of the laser with time was investigated in order to graduate the spectroscope and be able to measure the frequency interval between absorption lines and the width of these lines. A block diagram of the calibration device is shown. The radiation of the laser diode forms into a parallel beam into which the Fabry-Perot interferometer is placed with a resolution of $5 \cdot 10^5$. The distance between absorption lines and their width are functions of the position of the lines on an oscillogram relative to the beginning of the pulse, and this is related to the nonlinear dependence of the wavelength of the laser radiation on time. The reason for this is that generation modes of the laser are determined by the optical length of its resonator. The pulsed excitation mode leads to a nonlinear variation of the increase in temperature of the active region of the injection laser with time. This produces a change in the refractive index of the active medium which basically determines the change in the generation wavelength. The distance between absorption lines was 9.2 ± 0.1 GHz, corresponding to a value obtained by radiospectroscopy methods.

"Scanning Device Based On Injection Lasers"

Kvantovaya elektronika, Moscow, No 5, May 71, pp 101-102

Abstract: The feasibility is examined of creating a device for scanning the coherent emission of injection lasers with a potentiality for time and space control. The circuit of such a device was proposed and an operative model of it was prepared. The scanning device is a set of 10 lasers prepared from one single crystal of gallium arsenide. An autonomous inject pulse from a 10-channel power supply was fed to the p-region of each laser diode. Scanning is accomplished because of the delay of the injection pulses among themselves and the successive feeding of them to the straightedge of the lasers. The circuit of the pulse generator and an oscillogram of the emission are presented. The author thanks I.M. Divil'kovskiy's group for assistance in the work. Received by editors, 12 Feb 71; after revision, 12 Apr 71. 2 fig. 1 ref.

"Power Resonances and Frequency Stabilization of a Gas Laser With a Nonlinearly Absorbing Cell"

Moscow, Kvantovaya Elektronika, No. 1, 1971, pp 42-52

Abstract: Power resonances of a gas laser with a nonlinearly absorbing cell that are caused both by spectral effects (in a laser with a Fabry-Perot resonator) and by competition of spectral and spatial effects (in a laser with a ring resonator) are studied. The half-width of the power resonances of a laser with a Fabry-Perot resonator and a methane absorbing cell was of the order of 300 kHz. The half-width of resonances of a ring laser was ~30 kHz. The laser with a Fabry-Perot resonator and a methane cell stabilized at peak radiation displayed stability and a frequency generation equal to 10^{-11} . It is concluded that the use of power resonances of a ring laser as optical discriminators can raise the stability and generation of the radiation frequency by more than an order of 2.

"Power Resonances and Frequency Stabilization of a Gas Laser With Nonlinear Absorption Cell"

V sb. Kvant. elektronika (Quantum Electronics--collection of works), No 1, Moscow, 1971, pp 42-52 (from RZh-Radiotekhnika, No 5, May 71, Abstract No 5D181)

Translation: The paper deals with the power resonances in gas laser emission due both to the effect of spectral line burnout (laser with a Fabry-Perot resonator) and to the interaction of modes at frequencies close to the centers of lines of amplification or absorption (laser with annular resonator). In the latter case, power resonances may be appreciably narrower and more contrasting than those in a laser with Fabry-Perot resonator. Data are given on stabilization of a helium-neon laser with Fabry-Perot resonator with respect to the peak of emission caused by saturation of methane absorption. Seven illustrations, bibliography of sixteen titles.

"Investigating Narrow Resonance Within the Doppler Line of Rotational-Oscillating
Transitions of the SF₆ Molecule during Absorption Saturation"

Moscow, Zhurnal Eksperimental'noy i Teoriticheskoy Fiziki, Vol 59, No 2(8), 1970,
pp 394-403

Abstract: Experimental measurement was made of the amplitude and width of narrow
resonances within the Doppler line of rotational-oscillating transitions of the SF₆
molecule during the saturation of adsorption of a quasi-travelling wave from a CO₂
laser. The object of the experiment was to demonstrate the possibility of spectro-
scopy within the Doppler line by means of absorption saturation of a quasi-travelling
wave. The effects of resonance widening were determined for the first time. The
experimentally obtained large peak amplitude, along with its narrow width demon-
strated the usefulness of the method for stabilizing the CO₂ laser frequency. The
properties of a nonlinear spectrometer with a quasi-travelling wave are analyzed.

"Light Pulse Transmission Through a Two-Component Semiconductor Medium"

Moscow, Kvantovaya elektronika, No 7, 1972, pp 89-92

Abstract: This brief communication is concerned with the interaction of the radiation from an injection laser and a two-component semiconductor medium. This is defined as a medium which can be used for amplifying or absorbing light, depending on the controlling injection current applied to the semiconductor. The measurements described in the paper were made with a combination light-pulse oscillator and two-component semiconductor made of a single GaAs diode, one of the ends of the planar specimen coinciding with the (110) plane while the opposite end is set at a 10° angle with respect to the first to reduce positive light feedback. A diagram of this arrangement is shown. Measurements were conducted at a temperature of 80° K on specimens in which the oscillator was 0.8 mm long and the two-component medium 2 mm long. Curves for experimental and computed amplitude characteristics of the two-component medium are plotted, and show close agreement.

PROBLEMS OF INTEGRATED OPTICS

(Conference in the USA)

[Article by Vasilii V. Nikitin and
M. Ya. Shchelkin in Moscow, VESTNIK AKADEMII NAUK SSSR, RUSSIAN,
Vol. 42, No. 8, August 1972, pp. 92-95]

Integrated optics is a relatively new scientific and technical direction which arose 3-7 years ago on the border of classical optics and quantum electronics. The area of investigation of that direction is the propagation, transformation and amplification of electromagnetic radiation of the optical range in dielectric thin-film waveguides, and in fiber light conductors. Thin-film integrated devices are characterized by small dimensions, great noise resistance, and a considerable service life, and thanks to that are finding more and more applications in practice.

Investigations in integrated optics are being conducted on a broad front in many countries of the world. The First International Conference on Integrated Optics held on 7-10 February in Las Vegas, USA, was devoted to the results of these investigations. The organizers of the conference, in which 270 scientists from ten countries participated, were the American Optical Society, the International Union of Theoretical and Applied Physics, and its International Commission for Optics.

Examined at the conference was a broad circle of questions, of integrated optics connected with measurement techniques in that area, the technology of manufacture and search for materials, for active and passive integrated waveguides in the form of films and fibers, and the development of instruments and devices based on those elements.

One of the central problems of integrated optics is the creation of broad-band integrated waveguides with small losses for long-distance optical lines of communication. Studied in that

"Dependence of Laser Resonator Thermal Strain on Initial Temperature of Neodymium Glass Rod"

Kratk. soobshch. po fiz. (Brief Communications on Physics), 1973, No 3, pp 26-30 (from RZh-Fizika, No 10, Oct 73, Abstract No 10D837 by K. O. I.)

Translation: The interferometric method is used to measure the variation, with temperature, of the thermal strain of an Nd glass-based laser resonator at temperatures ranging from -20 to +85° C. Measurements were taken for two types of Nd glasses -- series and experimental lime silicate glass, which provides low resonator thermal strains. It is shown that within the limits of experimental error the magnitude of the resonator thermal strain does not depend on the initial rod temperature for either type of glass. It is noted that the quantity dn/dT of the investigated glasses weakly depends on the temperature in the -20 to +85° C range. Bibliography with 10 titles.

"The Effectiveness of Crude Viral Vaccine Against Marek's Disease"

Moscow, Veterinariya, No 8, 1973, pp 38-39

Abstract: A turkey herpesvirus antigenically related to the virus responsible for Marek's lymphoma was grown in chick embryo fibroblasts and utilized as a vaccine. The efficacy of the vaccine was tested on 1 day old chicks immunized intramuscularly with 500 PFU in 0.2 ml during an epizootic outbreak in Latvia. Mortality due to Marek's disease was 3.2-4.5 times less among the immunized chicks than among the unimmunized controls. Although 100% protection was not afforded the immunized chicks, the economic gains from an effective vaccine are obvious and indicate the importance of prophylactic immunization.

Central Aerohydrodynamic Institute) 1971, Vol 2, No 2, pp 58-65
(from Referativnyy Zhurnal, Raketostroyeniye, No 11, Nov 71.
Abstract 11.41.87 Resumé)

Abstract: Launches of automatic ionospheric "Yantar" laboratories with gaseous plasma-ionic engines up to 100-400 km altitudes were conducted with the aid of geophysical rockets, for the purpose of studying prospects of controlled flight, in upper layers of the atmosphere. Performance of gaseous plasma-ionic engines under ionospheric conditions was studied. Parameters characterising the ion jet-ionospheric plasma interaction, as well as parameters of neutral atmosphere were measured. Scientific data on conducted experiments is presented. 2 figures, 1 table, 11 references.

"On Gain Saturation in Semiconductor Lasers, Masers and Amplifiers"

O nasvishchenii koeffitsiyenta usileniya v poluprovodnikovykh kvantovykh generatorakh i usilitelyakh (cf. English above), Leningrad, 1970, 10 pp, bibl. of 3 titles (from RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10D150 Dep)

Translation: The authors consider the effect of saturation in semiconductors with regard to the finite time of damping of interband polarization and deformation of the distribution function for nonequilibrium carriers in the presence of an electromagnetic field. An expression is found for the amplification factor with regard to the finiteness of the polarization relaxation time at high field intensities (the saturation effect). An estimate is given of the contribution made by the deformation of the distribution function for nonequilibrium carriers in a strong field to the amplification factor. For fields with $E \geq 10^6$ V/s, $\tau_{ee} \sim 3 \cdot 10^{-13}$ s (τ_{ee} is the collision time for nonequilibrium carriers), this contribution is small and is determined by the expression $10^{-2}\kappa$, where κ is the amplification factor without regard to deformation. Authors' abstract.

REDUCE, INASMUCH AS POSSIBLE, THE TIME LAG BETWEEN THE CONCEPTION OF THE
ADVANCED IDEA AND ITS TRANSLATION INTO A NEW PRODUCT. THE FIRST STEP IN
THIS DIRECTION WAS THE REORGANIZATION OF THE RESEARCH AND DEVELOPMENT
FACILITIES OF THE MINISTRY. IT WAS DECIDED (1) TO CENTRALIZE, INASMUCH
AS POSSIBLE, BASIC RESEARCH AND DEVELOPMENT MANAGEMENT IN
CERTAIN AREAS OF THE INDUSTRY, (2) TO MAXIMIZE THE SPECIALIZATION OF
RESEARCH INSTITUTES AND DESIGN BUREAUS, (3) TO CREATE CLOSER RELATIONS
BETWEEN RESEARCH INSTITUTES AND DESIGN BUREAUS, AND INDUSTRY, (4) TO
STRENGTHEN AND EXPAND EXPERIMENTAL AND PILOT PLANT FACILITIES. AS A
RESULT, 15 LEADING (GOLOVNYYE) INSTITUTES, 2 BRANCHES OF THESE
INSTITUTES, AND 2 SPECIALIZED INSTITUTES HAVE BEEN REORGANIZED AS 17
COMPREHENSIVE SCIENTIFIC RESEARCH INSTITUTES, DESIGN PLANNING AND
TECHNOLOGICAL INSTITUTES, THE INFORMELEKTRO INSTITUTE. 17 OF THE 33
AFFILIATES OF LEADING INSTITUTES HAVE BEEN TRANSFERRED UNDER DIRECT
CONTROL OF INDUSTRIAL PLANTS. THE OTHER 16 ARE RESPONSIBLE TO THE
MINISTRY AND SERVE RIGIDLY DEFINED GROUPS OF INDUSTRIAL PLANTS.
SPECIALIZED INSTITUTES AND CORRESPONDING PLANTS WERE MERGED TO FORM FOUR
RESEARCH PRODUCTION CORPORATIONS, THE ELEKTROAPPARAT, THE
ELEKTROKERAMIKA, THE KUNDENSATOR, AND THE AKKUMULYATOR. IN THE PROCESS
OF BEING ESTABLISHED IS THE FIFTH CORPORATION, THE ELEKTROPRIVOD.
DESIGN PLANNING AND TECHNOLOGICAL BUREAUS HAVE BEEN ESTABLISHED AT EIGHT
LARGE INDUSTRIAL ENTERPRISES THAT FORMERLY HAD NONE.

ABSTRACT/EXTRACT--21 DESIGN TECHNOLOGICAL BUREAUS, WHICH FORMERLY WERE UNDER MINISTERIAL MANAGEMENT, HAVE BEEN TRANSFERRED TO INDUSTRIAL PLANTS. 10 SUCH BUREAUS WERE TRANSFERRED TO RESEARCH TECHNICAL CENTERS. ONLY 10 BUREAUS REMAIN UNDER DIRECT CONTROL OF THE MINISTRY. 16 PLANT RESEARCH LABUKATORIES HAVE BEEN RECLASSIFIED AS RESEARCH ORGANIZATIONS. THE ARTICLE DISCUSSES THE NEW RESEARCH AND PRODUCTION PLANNING PROCEDURE WHICH IS BASED ON INTRAMINISTERIAL ORDERS TREATED AS CONTRACTS. SUCH AN ORDER ENCOMPASSES ALL STAGES OF RESEARCH, THE EXPLORATORY STAGE THROUGH THE EXPERIMENTAL STAGE, AND THE MANUFACTURE OF NEW PRODUCTS OR THE APPLICATION OF NEW TECHNOLOGICAL PROCESSES. THESE ORDERS ARE BASED ON FIVE YEAR AND ANNUAL PLANS, DECREES OF THE GOVERNMENT, COORDINATION PLANS APPROVED BY THE STATE COMMITTEE FOR SCIENCE AND TECHNOLOGY, LONG RANGE PLANS, OR DECISIONS OF THE MINISTRY OR ITS MAIN ADMINISTRATIONS. PRINCIPAL CONSUMERS ARE MAIN INDUSTRIAL ADMINISTRATIONS OF THE MINISTRY. ITS TECHNICAL ADMINISTRATION, AND FUNCTIONAL ADMINISTRATIONS. THE FORMER ARE RESPONSIBLE FOR PROBLEMS AND PRODUCTS RELATED TO THEIR PROFILES. THE SECOND IS RESPONSIBLE FOR COMPLEX EQUIPMENT, THE DEVELOPMENT OF WHICH IS RELEGATED TO THE ORGANIZATIONS AND PLANTS OF SEVERAL MAIN ADMINISTRATIONS. THE LATTER ARE INVOLVED IN ECONOMICAL PROBLEMS. THE ARTICLE ALSO DISCUSSES IN SOME DETAILS THE ECONOMIC INCENTIVES AND FINANCING OF RESEARCH AND DEVELOPMENT PROJECTS. A CHART IS GIVEN WHICH SHOWS HOW VARIOUS FUNDS ARE ALLOCATED.

CALCULATING THE TRANSIENT PROCESSES IN LIQUID-METAL MAGNETOHYDRODYNAMIC DEVICES

[Abstract of a Paper by Yu. M. Nikitin, Yu. A. Nikitina, Given at a Magnetohydrodynamic Conference, pp 122-123]

A study was made of the transient process in liquid-metal magnetohydrodynamic devices with a rectangular channel of ionRH b, the two walls of which $x = 0$ perpendicular to the applied magnetic field are insulators, and the other two are well-conducting electrodes. The external circuit can contain a source of emf \mathcal{E} and the complex load resistance \mathbf{z} (Figure 1). In addition, in the case of circuits with self-excitation the excitation windings must be included correspondingly in the external circuit. During the analysis it was assumed that $b \gg a$ and $L \gg b$ which permitted neglect of the transversal effects and consideration of the flow developed and described by the equations

$$\frac{\partial \mathbf{B}}{\partial t} - \frac{\partial \mathbf{J}}{\partial z} + \mathbf{A} \times \nabla \phi = 0 \quad (1)$$

$$m(B_x E_x) = R_m J_x = R_m(\sigma B_x \dot{\phi} + \mathcal{E}) \quad (2)$$

$$m(E_x) = -\frac{\partial \dot{\phi}}{\partial z} \quad (3)$$

with the boundary conditions $\sigma J_x|_{x=0} = J_x|_{x=L} = 0$.

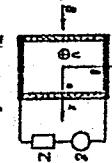

Figure 1

JPRS 60634

NIKITIN, Yu. M.

where $C(\chi_0, \psi_0)$ is the Green function.

For a number of problems the Green function can be constructed by using the conformal transform of the given regions into canonical. This method can be used to solve the problems of the entry and exit of the conducting medium in the magnetic field in the constant-cross section and variable-cross section

INTEGRAL METHOD OF STUDYING THE TERMINAL AND BOUNDARY EFFECTS IN MAGNETOHYDRODYNAMIC CHANNELS WITH NONUNIFORM DISTRIBUTION OF THE PARAMETERS OF THE CONDUCTING LIQUID

(Abstract of a Paper by Yu. A. But, L. K. Kovalev, Yu. N. Nikitin, I. A. Nika-

tin, V. K. Trulin Given at a Magnetohydrodynamic Conference, pp 112-114]

When studying the terminal and boundary effects in magnetohydrodynamic channels, it was decided to use the kinematic approximation where the velocity distribution v and the conductivity distribution σ are given from the solution of the hydrodynamic problem or from the experiment [1]. A study was made of the terminal effects for $v^1 = \text{const}$ and $\sigma^1 = \text{const}$ in [1, 2], in which the solutions were obtained in the form of infinite series. The nonuniformity of v and σ can turn out to have a noticeable effect on the electrical characteristics of the magnetohydrodynamic channel. Some of the problems with the variable v were investigated in [3]. The proposed integral method of investigation of the terminal and boundary effects permits consideration of the non-uniformity of the velocity and conductivity profiles and obtaining an exact solution in a broad class of problems.

The potential distribution for ϕ and the current density J during the flow of a conducting liquid with $\sigma = \text{const}$, $R_0 \ll 1$ and $\beta \ll 1$ are found from the equations

$$\Delta\phi = \delta \ln \sigma^2, \quad J = -\sigma(-\nabla\phi + \mathbf{B}/\mu)$$

The solution of equation (1) for the two-dimensional region in internal form has the form

$$\begin{aligned} \Delta\phi(\chi, \psi) = & \frac{1}{2\pi} \int \int d\chi_0 d\psi_0 C(\chi_0, \psi_0) \frac{\partial \ln \sigma^2}{\partial \chi} (\chi_0, \psi_0) - \\ & - \frac{1}{2\pi} \int \int d\chi_0 d\psi_0 C(\chi_0, \psi_0) \frac{\partial \ln \sigma^2}{\partial \psi} (\chi_0, \psi_0), \end{aligned} \quad (3)$$

"Desulfurization of Drops of Iron and Steel in Molten Slag Under the Effect
of an Electric Current"

Moscow, IVUZ. Chernaya Metallurgiya, No 4, 1972, pp 15-17

Abstract: A study was made of desulfurization of drops of iron (3% carbon) and steel (1.2% carbon) in synthetic slag during passage of an electric current. Increasing the electric field strength and raising the concentration of sulfur in the metal accelerates the desulfurization process. Desulfurization is also accelerated by increasing the basicity of the slag and its ferrous oxide content. An electric current can also accelerate the transfer of sulfur from slag to metal.

ADSORPTION AND ADSORPTION HEATS
OF VAPORS ON GEOMETRICALLY MODIFIED SILICA GELS

Yekabson, Ya. Ya.; Kiselev, A. V.; Kyznetsov, B. V.;

Nikitin, Yu. S.

The measurements of the adsorption extent and adsorption heats of water and benzene vapors have shown that macroporous silica gels obtained by hydrothermal treatment in an autoclave followed by calcination at 900 and 1000° for 6—10 hours and rehydroxylation contain very few ultrapores and in respect to their surface chemistry are similar to silica without ultrapores. A longer calcination of macroporous silica gel at 1000° leads to the appearance of microcracks in it and to an increase of its ultraporosity.

EFFECT OF HYDROPHOBIZATION ON THE THICKENING ABILITY OF
SILICA (AEROSIL AND SILICA GEL)

Sinitsyn, V. V.; Bakaleynikov, M. B.; Akshinskaya, N. V.;
Nikitin, Yu. S.

Summary

The aerosil and silica gel surfaces have been subjected to waterproofing treatment with n-butanol under different conditions. The thickening ability of untreated aerosil of different types: «175», «300» and «380» is approximately the same, regardless of its surface area determined with water and methanol. With increasing waterproofing degree, the thickening ability of aerosil diminishes. With the same waterproofing degree the thickening ability of aerosil subjected to the vapor-phase modification is higher than after treatment in an autoclave. The thickening ability of large-pored high-dispersed silica gel, both initial and modified, is much higher than for aerosil.

"Purification of Magnesium Production Gases to Remove Chlorine in Hollow Scrubber"

Tr. Vses. N-i. i Proyektn. In-ta. Alyumin., Magn. i Elektrodn. Prom-sti [Works of All-Union Scientific Research and Planning Institute of the Aluminum, Magnesium and Electrode Industry], 1970, No. 72, pp. 123-132. (Translated from Referativnyy Zhurnal Metallurgiya, No. 5, 1971, Abstract No. 5 G203 by the authors).

Translation: The influence of the composition of the absorbent, speed and direction of gas flow, and sprinkling density on absorption of Cl by lime milk was studied in an industrial scrubber. The decrease in the degree of gas purification resulted from a change in the hydrodynamic conditions in the scrubber due to foaming of the absorber. Foaming began at concentrations of $\text{Ca}(\text{ClO})_2$ of 45-60 g/l with various contents of $\text{Ca}(\text{OH})_2$ and resulted from decomposition of the $\text{Ca}(\text{ClO})_2$. Addition of CaCl_2 to the absorbent (initial content 100 g/l) did not change the indices of absorption. With counterflow movement of the phases, increasing the gas speed from 1 to 2.5 m/sec improved purification. The effectiveness of operation of the direct flow zone of the scrubber was decreased with increasing gas speed. Increasing the sprinkling density from 18 to 60 $\text{m}^3/\text{m}^2\cdot\text{hr}$ helps to improve the absorption indicators. With counterflow, the empirical equation $K_V=2.75 \cdot W^{1.25} \cdot L^{0.67}$ was produced, where K_V is the volumetric coefficient of the rate of absorption, $\text{kmol}/\text{m}^3\cdot\text{hr}\cdot\text{bar}$, W is the gas speed, m/sec, and L is the sprinkling density, $\text{m}^3/\text{m}^2\cdot\text{hr}$. 6 figs.

"Plant Immunity to Different Kinds of Parasites"

Leningrad, Mikologiya i Fitopatologiya, No 6, 1972, pp 235-240

Abstract: Long-term studies on different plant families (Gramineae, Chenopodiaceae, Solanaceae) show that they have similar immunological responses to fungus infections regardless of the biological characteristics, evolutionary development, and nature of the parasitism of the pathogens, e.g., Erysiphe graminis, Ustilago zae, Cercospora beticola, Peronospora schachtii, Tilletia tritici, Sphaelotheca panici-miliacea, and Puccinia triticina. These pathogens all undergo recessive changes in the host plants in the form of hypoplasia, plasma degeneration, and lysis. It would appear, therefore, that the processes by which physiological immunity is formed are basically similar even when induced by different agents.

LIT-4. THERMAL AND DIFFUSION SUPERCOOLING OF A MELT AND ITS RELATION TO THE

CRYSTAL PROCESSES

[Article by G. V. Nikitina, E. V. Osnanska, V. M. Romanenko, V. S. Khoifets,
Translated from *Zhurnal Kristallografiya*, No. 1, 1972, p. 150]

Directional crystallization is accompanied by the occurrence of a temperature gradient and a concentration gradient in front of the growth front. The magnitude of both gradients is connected with the growth rate of the crystal and the magnitude of the external temperature gradient in the device. At high concentrations of the admixture, the exceeding of a critical value of the growth rate leads to the occurrence of diffusion or concentration supercooling of the melt in the crystal. In the solid phase concentration inhomogeneities are observed in this case. It was demonstrated previously [1] that the value of f_k essentially depends on the concentration. Experimental data are presented on the growth of the crystals of the bismuth-samarium system containing these calculations. However, for low concentrations of the admixture, the unusual theory of diffusion supercooling gives an increase in the value of the critical growth rate. In this paper it was demonstrated that in this case it is necessary to consider two new factors: diffusion supercooling which occurs on crystalization of complex compounds as result of deviation of the composition from stoichiometry (in this case the excess component plays the role of the admixture) and the occurrence of thermal supercooling of the melt. It occurs as a result of the fact that at increased growth rates, the amount of heat which must be removed deep in the melt increases sharply. On occurrence of this effect, structural defects appear in the growing solid phase. The theoretical principles of this effect were developed. They permit calculation of the magnitude of the critical growth rate for the effect of thermal supercooling. A comparison was made with the experiment. It confirmed the correctness of the calculations.

CALCULATING THE TRANSIENT PROCESSES IN LIQUID-METAL MAGNETOHYDRODYNAMIC DEVICES

[Abstract of a Paper by Yu. M. Nikitin, I. A. Nikitina Given at a Magnetic-dynamic Conference, pp 127-135]

A study was made of the transient processes in liquid-metal magnetohydrodynamic devices with a rectangular channel of length L , the two walls of which are perpendicular to the applied magnetic field and are wall-conducting electrodes. The external circuit can include a source of emf E and the complex load resistance R (Figure 1). In addition, in the case of circuits with self-excitation the excitation windings must be included correspondingly in the external circuit. During the analysis it was assumed that $L \gg a$ and $L \gg b$ which permitted neglect of the parabolic effects and consideration of the flow developed and described by the equations

$$\frac{\partial \psi}{\partial t} = -\frac{d\psi}{dx} + \alpha \psi \cdot \frac{\partial \psi}{\partial x},$$

$$\text{rot}(\psi \mathbf{B}_0) = R_m \mathcal{I} - R_m(\tau \psi \mathbf{B}_0 \cdot \mathbf{E}),$$

$$\text{rot} \mathbf{E} = -\frac{\partial \psi}{\partial t},$$

with the boundary conditions $\psi_0 = \psi_L = 0$.

INTEGRAL METHOD OF STUDYING THE TERMINAL AND ROTATION EFFECTS IN MAGNETOHYDRODYNAMIC CHANNELS WITH NONUNIFORM DISTRIBUTION OF THE PARAMETERS OF THE CONDUCTING LIQUID

[Abstract of a Paper by D. A. But, I. A. Kovalev, N. M. Nikitina, I. A. Nikitina, V. V. Tulin Given at a Magnetohydrodynamic Conference, pp 112-117]

When studying the terminal and boundary effects in magnetohydrodynamic channels, it was decided to use the kinematic approximation where the velocity distribution v and the conductivity distribution σ are given from the solution of the hydrodynamic problem or from the experiment [1]. A study was made of solutions where $v = \text{const}$ and $\sigma = \text{const}$. In [1,2], in which the series of the magnetic hydrodynamic channel, the nonuniformity of variable v were investigated in [1]. The proposed integral method of investigation of the terminal and boundary effects permits consideration of the nonuniformity of the velocity and conductivity profiles and obtaining an exact solution in a broad class of problems.

The potential distribution for ϕ and the current density J during the equations

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} - \frac{\partial \phi}{\partial x} \cdot \frac{\partial v}{\partial x} + \frac{\partial \phi}{\partial y} \cdot \frac{\partial v}{\partial y} = 0 \quad (1)$$

The solution of equation (1) for the two-dimensional region is integral

$$\begin{aligned} \Re \phi_0 = & \int_{\Gamma} \frac{\partial \phi}{\partial n} G(x_0, y_0) \frac{\partial \phi}{\partial n} d\Gamma - \int_{\Gamma} \frac{\partial \phi}{\partial n} G(x_0, y_0) J d\Gamma \\ & - \int_{\Omega} \frac{\partial \phi}{\partial n} G(x_0, y_0) J d\Omega \end{aligned} \quad (2)$$

where $G(x_0, y_0)$ is the Green function.

For a number of problems the Green function can be constructed by using the conformal transforms of the given regions into canonical. This method can be used to solve the problems of the entry and exit of the conducting medium in the magnetic field in the constant-cross section and variable-cross section

CHANGE IN GROWTH PROCESSES IN IRRADIATED LETTUCE SEEDS

Article by Dr. I. Shandorov, ^{Sh.-Fiz.-Tekn. Biolog.}
V. A. O. Stravyn and Vr. N. Sazanava ^{Izdat. L. V. Alekseev}
^{Redaktsiya. Redakcija. Vol. 5, No. 6, 1971, submitted for publication 25 June}
1971, pp 21-25

Abstract: The effect of spaceflight factors and ionizing radiation on the biological effectiveness of γ -rays was studied with respect to lettuce seeds. It was found that the flight exerted no significant effect on the course of seed germination. The length of the primary root in flight specimens irradiated before flight was similar to that in the ground control. According to the test, flight factors increased the effectiveness of postflight irradiation insignificantly. The influence of a synchronous exposure inhibited the weight of 10-day plants to the greatest extent. The total exposure to all the doses tested during the flight resulted in a slight decline of plant weight in comparison with the laboratory control.

We studied the influence of flight factors and ionizing radiation on initial growth processes (sprouting energy and germination of seeds, growth of the primary root), and also on the appearance of aftereffects of the studied phenomena in growing plants. The experimental plan provided for a classification of the influence of flight factors on the appearance of a radiobiological effect (seed irradiation prior to flight) and the radiosensitivity of seeds (seed irradiation after flight). As is well known, the radiation effect on dry seeds begins to appear with the onset of their germination. At that time one observes both the realization of the damage and the oppositely directed processes associated with a normalization of plant growth mechanisms. During the initial growth period the damaging effect of radiation is most clearly manifested. With an increase in plant age recovery processes begin to predominate and in the case of small irradiation doses the radiation effect can be smoothed out.

78550k Preparation of mesitylene and durene by the isomerization and disproportionation of pseudocumene. Kolyandr, I. V.; Privalov, V. E.; Fomenko, G. M.; Nikitin, N. A.; Krish-Lokshina, L. S.; Kochergin, V. A.; Khvatkov, N. N.; Krish-topa, A. P.; Bilym, L. M.; Grebinik, Z. G. (Kadity, B. O.) khim. Zavod, Kadievka, USSR). Koks Khim. 1970, (1), 33-40 (Russ). 1,2,4-Me₃C₆H₃ (I) of 90-5% purity was prep'd. by rectifying coke chem. solvents (20-35 and 10-20% Me₃C₆H₃, 4-6 and 3-5% m + p-EtC₆H₄Me, 15-17 and 10-12% 1,3,5-Me₃C₆H₃ (II), 1-1.2 and 0.7-0.9% o-EtC₆H₄Me, 16-18 and 12-14% I, 1-2 and 2-3% 1,2,3-Me₃C₆H₃, 2-6 and 1-3% satd. hydrocarbons, and 0 and 2-3% unsatd. compds.) on columns having 50 theoretical plates at a reflux no. of 60-100. Isomerization and disproportionation in the presence of 30% of an AlCl₃-I complex at 127° for 3 hr in exptl. app. yielded 4.00% C₆H₆-PhMe-satd. compds., 17.27% Me₃C₆H₃, 17.02% II, 35.09% I, and 10.71% durene (III). Yields in plant runs were similar. Rectification of the II fraction on a lab. column having 75 theoretical plates at a reflux no. of 80-100 yielded II of 97.5% purity in 39.24% yield. After rectification to increase III concn. to 45.94% in the III fraction, recrystn. at 5 to -18° yielded III of ~82% purity and further recrystn. with 35% PhMe gave III of ~97% purity in ~85% yield (17% selectivity from I and 1.6% from the coke chem. solvent). "Spectral Determination of Tantalum and Tungsten in Gallium-Based Alloy"

Moscow, Zavodskaya Laboratoriya, No 12, 1972, pp 1467-1469.

Abstract: A method is described for spectral determination of tantalum and tungsten in a gallium-based alloy. By the use of fluorination and a special method of photography of the spectrum, the sensitivity of the determination is increased to 0.001% and the specimen remains in the electrode channel. The variation factor for a single spectrum in the determination of tungsten is 25%, in the determination of tantalum -- 17%.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. FIXED RABIES VIRUS (SAD STRAIN)
WAS PASSAGED SERIALLY IN PRIMARY CULTURES OF SYRIAN HAMSTER KIDNEY AT
37DEGREES FOR 47 PASSAGES, AT 32DEGREES FOR 31 PASSAGES AND AT
28-26DEGREES FOR 11 PASSAGES. THE "COLD" VARIANTS OF THE VIRUS WERE
SHOWN TO MULTIPLY VERY POORLY AT HIGH TEMPERATURES (40DEGREES) (RCT
SUB40 PRIME NEGATIVE MARKER) BUT THE ORIGINAL VIRUS SHOWED QUITE ACTIVE
REPRODUCTION (RCT SUB40 PRIME POSITIVE MARKER). COMPLETE CORRELATION
WAS OBSERVED BETWEEN LOW REPRODUCTION ACTIVITY OF RABIES VIRUS IN SYRIAN
HAMSTER KIDNEY CULTURE AT 40DEGREES AND ITS LOW VIRULENCE FOR LABORATORY
ANIMALS.

ABSTRACT. IN THE PROCESS OF STEROTAXICAL DIAGNOSTIC AND THERAPEUTICAL MEASURES IN PATIENTS WITH HYPERKINESSES, THE AUTHORS ACCOMPLISHED A COMPREHENSIVE STUDY OF THE VEGRYATIVE AND CARDIOVASCULAR SEMIOLOGY OF SOME DEEP BRAIN STRUCTURES. THESE DATA TESTIFY TO A DIFFERENT DEGREE OF INVOLVEMENT OF THE SUBCORTICAL STRUCTURES AND THALAMIC NUCLEI IN THE MECHANISMS OF CENTRAL REGULATION OF THE VEGETATIVE FUNCTIONS. BESIDES THE THEORETICAL SIGNIFICANCE FOR THE PHYSIOLOGY OF DEPTH HUMAN BRAIN STRUCTURES, THE OBTAINED DATA ARE OF INTEREST FOR THE SELECTION OF "NUCLEARTARGETS" IN SURGICAL TREATMENT OF THE DIFFERENT EXTRAPYRAMIDAL AND OTHER DISEASES ACCORDING TO THE STEROTAXICAL METHOD.

"Effect of Glucocorticoids on Some Indices of Mineral Metabolism in Chronic
Berylliosis Patients"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 9, Sep 70, pp 31-34

Abstract: Blood and urine magnesium and calcium levels were determined in 22 patients with chronic berylliosis before and 20-30 days after treatment with prednisolone (15 mg daily, total 175 to 250 mg). One group of patients had not previously taken any glucocorticoids, while another group had taken them for 1-1/2 to 7 years. Before treatment, the first group exhibited a marked decrease in, and increased urinary excretion of plasma magnesium, together with a high serum calcium concentration and low calcium excretion. The second group exhibited the same changes in the electrolytes before treatment as the first group, but they were less pronounced. The administration of prednisolone brought these indices up to the control values in both groups and normalized the magnesium-calcium balance. The condition of all of the patients also improved as indicated by a decrease in dyspnea, cyanosis, and inflammation of the lungs. The therapeutic effect of small doses of glucocorticoids is due to their triggering 1/2
