ZLATCUSTOV, S.V., et al, Izvestiya VUZ - Radioelektronika, Vol 13, № 9, 1970,  
pp 1124-1128

The authors' analysis of the results of the experiment showed a high correlation between resistor noise and quality, with the noisiest resistors exhibiting the poorest quality, to the extent that the reliability of resistors can be predicted on the basis of their showing in this test. In these experiments, the noise level was measured in microvolts per volt of applied voltage in a band of 10 kHz. The authors conclude that 100% control can be attained in control automation using the modulation noise meter they propose in thin-film resistor assembly line manufacture.

"Calculation of Nonstationary Longitudinal Oscillations of a Plate Reinforced at the Edge of the Half-Space"

Tr. koordinats. sovesch. po gidrotekhn. (Works of the Coordination Conference on Hydraulic Engineering), 1972, No. 64, pp 61-69 (from RZh-Mekhanika, No 3, Mar 73, Abstract No 3V85)

Translation: The nature of the propagation of elastic waves in a plate fastened by one edge to the boundary of a half-space is investigated. The case of symmetric loading of the boundary of the half-space is considered when only symmetrical oscillations arise in the half-space and longitudinal waves are propagated in the plate. Stresses along the contact of the plate and the half-space are taken as uniformly distributed. Graphs are given for the change of stresses and displacements with time for a sudden application of loads to the boundary of the half-space and the upper edge of the plate, and for different relationships of the elastic modulus of the plate and the elastic modulus of the half-space. Authors' abstract.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS ANALYZE THE RESULTS OF TRANSUMBILICAL INJECTION OF ANTIBIOTICS AND OTHER SUBSTANCES IN 8 PATIENTS WITH ABSCESSSES OF THE LIVER, 6 OF WHOM RECOVERED. IN PATIENTS WITH HEPATIC ABSCESSSES THE AUTHORS RECOMMEND THE USE CANNULATION OF THE UMBILICAL VEIN FOR DIAGNOSTIC PORTOHEPATOGRAPHY AND SUBSEQUENTLY FOR PROLONGED INTRAPORTAL INFUSION OF MEDICINAL SUBSTANCES AS A SEPARATE METHOD OF TREATMENT OR IN COMBINATION WITH OPENING AND DRAINAGE OF ABSCESSSES. THE THEORETICAL SUBSTANTIATION OF THE EMPLOYMENT OF TRANSUMBILICAL INJECTION OF ANTIBIOTICS AND DRUGS IN THE TREATMENT OF PATIENTS WITH PYOGENIC ABSCESSSES OF THE LIVER WITH THE AID OF MICROBIOLOGICAL TECHNIQUES THE AUTHORS DEMONSTRATE BY THE FACT OF GREATER CONCENTRATION OF DRUGS IN THE ZONE OF THE PATHOLOGICAL FOCUS, THUS ENSURING A MORE PRONOUNCED CURATIVE EFFECT.

TRANSUMBILICAL INFUSION OF MEDICINAL SOLUTIONS  
AND BLOOD

Ostroverkhov, G. Ye.; Nikol'skiy, A. D.; Kotov, I. A.  
Komarev, I. A.; Murashova, Z. M.

In 23 cases the authors used transumbilical infusion of medicamentous solutions to normalize venous pressure. Intraportal introduction of such solutions was found to bring down the pressure in peripheral veins, thereby improving the work of the right heart. Transumbilical infusion of medicinal agents practised in operations on the organs of the abdominal cavity contributes to the normalization of metabolism, raises antitoxic function of the liver and acts beneficially on the regulation of hemodynamics.

"Experimental Investigation Of A Narrow Electron Beam With High Power Density At Crossover"

Elektron. tekhnika. Nauchno-tekhn. sb. Elektron SVCh (Electronic Technology. Scientific-Technical Collection. Microwave Electronics), 1970, No 7, pp 46-51  
(from RZh-Elektronika i yeye primeneniye, No 11, November 1970, Abstract No 11A274)

Translation: The method of a scanning diaphragm is used for investigation of the structure of a thin (20-50 micrometer) electron beam with a power density at crossover of  $10^6$ - $10^8$  watt/cm<sup>2</sup>. The experiments were conducted on the electrooptical system of a unit (typical for industrial conditions) for dimension processing of materials, with an accelerating voltage of 80-100 kv and beam currents of 1-4 mA in a pulse. The measuring diaphragm was produced from monocrystalline tungsten and was cooled by water. After the diaphragm, the electrons of the beam enter into a collector (a Faraday cylinder), and the electron current is displayed on an oscilloscope [otsillografiruyetsya]. With the aid of a deflecting system, the beam under investigation is expanded at the surface of the diaphragm. The experiments show that the distribution of the current density agrees with a precision up to 10 percent with Gauss' law, and the character of the change of the radius of the electron beam, the current density, and the power density at its smallest cross section is the result of a change of the size and position of the cross over which is shaped by a triode electron gun. ## Powder Metallurgy

USSR

UDC 669.162.212

SAMSONOV, G. V., YEROSHENKO, A. I., OSTROVERKHOV, V. I., KRAT, V. A., and DUBOVIK, T. V., Institute of Problems of Material Science, Academy of Sciences Ukr SSR and Brovary Powder Metallurgy Plant

Kiev, Poroshkovaya Metallurgiya, No 12, Dec 72, pp 46-48

**Abstract:** The technology for production of large-scale parts from boron carbonitride with a diameter of 100-300 mm has been developed jointly by the Department of Refractory Materials at the Institute of Problems of Material Science and the Brovary Powder Metallurgy Plant. The following maximum and minimum values of the different properties are presented:

USSR

SAMSONOV, G. V., et al., Poroshkovaya Metallurgiya, No 12, Dec 72, pp 46-48

Vaporization rate, g/cm <sup>2</sup> -sec at 1515°C	6.78x10 <sup>-9</sup>
at 1927°C	4.43x10 <sup>-6</sup>
Compressive strength, kg/mm <sup>2</sup> , at 20°C	1.59
at 2020°C	4.75
Bend strength, kg/mm <sup>2</sup> , at 20°C	1.80
Modulus of normal elasticity, kg/cm <sup>2</sup> , at 20°C	138300
at 1800°C	122500

The physical and engineering properties of boron carbonitride allow it to be recommended for use as refractory and electrical insulation material for crucibles, vats, pipe for transfer of molten metals, alloys slags and salts, jackets for thermocouples, refractory lining plates and high-temperature electrical insulators at temperatures up to 2000-2500°C. One table, 5 bibliographic references.

Moscow, Plasticheskiye Massy, No. 12, Dec 70, pp 53-54

**Abstract:** The article describes synthesis of fiberglass plastics based on carbamide binders. These binders include a carbamide oligomer modified by polyvinylacetate emulsion during synthesis, and urea-benzoguanamine-formaldehyde oligomer. Fiberglass textolites based on these oligomers and TS-8/3-250 glass treated with lubricant 752 are mechanically strong. In addition to its excellent strength properties, the plastic based on urea-benzoguanamine-formaldehyde oligomer is also water-resistant.

"Production Technology of Nickel-Base Brazing Alloys in Powder Form"

Kiev, Poroshkovaya metallurgiya, No 2, May 72, pp 82-88

**Abstract:** The objective of the study was to develop an optimum production technology for Ni-base alloys in powder form for brazing structures from thin-sheet high-alloy steels. The test materials were powders of PKh12N75S8R-grade Ni-Cr-Si-Fe-B brazing alloy and MA--a mixture of 85% of PKh12N75S8R with 15% molybdenum. PKh12N75S8R was successfully used to braze OKh18N10, LKh18NT, and Kh25N16G7AR high-alloy steels. The brazing temperature was 1180°C and the secondary melting (unsoldering) temperature---1080°C. Addition of molybdenum (15%) to Kh25N16G7AR was found to raise the unsoldering temperature by 130°C and ensure a joint tensile strength of 30 kg/mm<sup>2</sup>. "Double-Wavelength, Single-Exposure Holographic Plasma Interferometry"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, vol. 41, No. 2, 1971,  
pp 417-423

**Abstract:** This paper is connected with an article written by the third-named of the authors above and published in the same journal (vol. 40, No. 11, 1970). In this earlier article the author proposed a method of double-wavelength, single-exposure holographic interferometry in which the form and position of the interference bands are determined only by the dispersion characteristics of the investigated object. Essentially, this method involves two wavelengths, one of which is half the other, radiated by a hologram of a phased object on photomaterial with a light transmissivity which is a non-linear function of the illumination on it. In the present paper,

1/2

USSR

IGNATOV, A. B., et al, Zhurnal Tekhnicheskoy Fiziki, Vol. 41, No. 2, 1971,  
pp 417-423

a closer and more detailed look is taken at this method, and a description is given of the first attempt to use it for interferometric investigation of a plasma. The authors found that dispersion interferometry gives results which are inferior to those of their method. They are with the A. F. Ioffe Physico-Technical Institute of Leningrad.

"Fragmentation of Plant Chloroplasts as a Method for Studying the Organization  
of Photosynthetic Units"

Kiev, Fiziologiya i Biokhimiya Kulturnykh Rasteniy, Vol 3, No 3, 1971, pp 252-263

**Abstract:** This is a review of research done at the author's Department of Photosynthesis and Biochemistry as well as of the published literature devoted to the fragmentation of chloroplasts by detergents. Also covered are studies of the effects of light and heavy particles. The study of disaggregation of chloroplasts and of the properties of membrane fragments of tilakoids, which are more or less complex molecular systems containing various collections of pigments, enzymes, and coenzymes, emerged as a major field of research in the late sixties. Boardman and his group were first to isolate molecular aggregates of chloroplast membranes corresponding to photochemical systems I and II, that is, they could isolate so-called photosynthetic units and obtain them in a relatively pure form. Since then a number of detergents have been found to be suitable for the fragmentation of plant chloroplasts and chloroplasts of chromatophoric bacteria, in addition to the original digitonin: Triton X-100, which

USSR

OSTROVSKAYA, L. K., *Fiziologiya i Biokhimiya Kulturnykh Rasteniy*, Vol 3, No 3,  
1971, pp 252-263

(at a concentration of only 0.007%) accelerates the photoreaction with ferri-cyanide, (2,6-dichlorophenol)indophenol, and other oxidizing agents. At detergent concentrations of 0.01-0.02%, the Hill reaction is largely inhibited. It had been found also that Triton X-100 has a destructive effect on photosystem II, extracting chlorophyll more intensively than does digitonin. The author's group set out to study more intensively the difference between detergents digitonin and Triton X-100. Some details of this study are given. They found that Triton X-100 leads to partial breakdown of both photosystems. Triton affects the lipid components of either system. Data on the lipid distribution in fragment fractions obtained from corn chloroplasts are given. Electron microscope studies showed that Triton X-100 attacks the surface of chloroplast grain discs. The work of a number of other authors is reviewed and discussed, including various methods developed for mechanical breakdown of chloroplasts, the photophosphorylation mechanism (which was studied by various institutes of the Soviet Union), low-temperature fluorescence spectroscopy used in the study of the effect of hydrolytic enzymes on the structure of chloroplasts or on the photochemical activity of the latter. Other research discussed pertains to the use of galactolipase and its effect on digalactosyldiglycerides -- a comprehensive

"Neurotropic Properties of Fluzophenazine"

Moscow, Farmakologiya i Toksikologiya, Vol 34, No 3, May-Jun 71, pp 287-290

Abstract: Neurotropic properties of fluzophenazine -- 10-( $\gamma$ -[4-( $\beta$ -hydroxyethyl)-pipersinyl-1]-propyl)-2-trifluoromethylphenothiazine dihydrochloride were investigated. The drug was found to be a highly potent neuroleptic. It produced catalepsy, inhibited conditioned reflexes of avoidance, spontaneous motor activity, averted phenamine-induced hyperactivity, prolonged and potentiated the anesthetizing effect of sodium thiopental and hexobarbital, synchronized EEG, and blocked EEG-activation provoked by an acoustic stimulant and phenamine. Fluphenazine is an extremely potent antiemetic. Compared with triflazin, fluphenazine is less toxic and exceeds trifluoperazine in neurotropic activity.

"Increased Resistance of Mice to Hypoxia Under the Influence of Tranquilizers of the Benzodiazepine Series"

Moscow, Byulleten Eksperimentalnoy Biologii i Meditsiny, Vol. 71, No. 2, Feb 71, pp 45-47

**Abstract:** Hypoxia frequently accompanies surgery as a result of oxygen deficiency of the plasma in peripheral vessels. Also, hypoxia may develop at various stages of an operation, such as in interruption of blood circulation. It is therefore important to study all compounds administered during operations for their effects on hypoxia. The effect of diazepam, chlordiazepoxide, and nitrazepam on the survival time of white mice in a test chamber with reduced oxygen content (8.7 vol %) was studied. The test substances were administered intraperitoneally in doses of 10 mg/kg. Meprobamate (in doses of 50 and 100 mg/kg) and aminazin (in doses of 5 and 20 mg/kg) were included in this study for comparison purposes. Diazepam (at doses substantially below toxic doses) was most effective in prolonging the survival of mice under the

No 2, Feb 71, pp 45-47

above conditions, but the other tranquilizers also exhibited beneficial effects. Heprobamate and aminazin did not show a pronounced protective effect. It was postulated that the antispasmodic effect and the hypodynamia effect, which are of great importance for the activity of barbiturates during hypoxia, are not essential for benzodiazepine derivatives. Rather, the protective effect of these compounds is attributed to some specific intervention in the metabolism whereby the sensitivity of the tissues to oxygen insufficiency is reduced. Preliminary experiments indicated that the cortical structures of the brain especially appear to derive enhanced resistance to oxygen deficiency. It was concluded that diazepam will find clinical use.

"The Effect of Sodium Oxybutyrate on Oxidative Processes in Brain Tissue During Hypoxia"

Moscow, Byulleten' Eksperimentalnoy Biologiyi i Meditsiny, No 4, 1970, pp 70-72

Abstract: Experiments with mice demonstrated the ability of sodium oxybutyrate to increase the intensity of oxidative processes in the cerebral cortex and the spinal cord under conditions of normal respiration. The ability of sodium oxybutyrate to prevent the development of inhibition of tissue respiration in animals under conditions of hypoxia was also shown. It was demonstrated that, in this respect, sodium oxybutyrate differs from typical narcotics and tranquilizers. Neither nembutal nor aminazin reduced the degree of inhibition of tissue respiration caused by hypoxia.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN ACUTE EXPERIMENTS ON 30 CATS AND SODIUM OXYBUTYRATE, STIMULANTS (BEMEGRIDE AND CAFFEINE) AND NEUROLEPTICS (CHLORPROMAZINE AND TRIPHTHAZINE) ON THE RESPONSE OCCURRING IN THE BULBAR PYRAMIDS IN ELECTRODERMAL STIMULATION. THE STUDIED NARCOTICS REVEALED A CAPACITY TO SUPPRESS THE REFLEX PYRAMIDAL RESPONSE. UPON ANALYSIS OF THIS EFFECT IT IS SHOWN THAT OUT OF THE WHOLE REFLEX ARCH, PARTICIPATING IN THE REALIZATION OF THIS RESPONSE, THE GREATEST SENSITIVITY TO NARCOTICS ELICITE INTRACORTICAL CONNECTIONS WHICH CARRY OUT THE SWITCHING BETWEEN SENSORY AND MOTOR REGIONS OF THE CORTEX. THE REFERRED TO EFFECT COULD BE ELIMINATED BY STIMULANTS. IT IS SHOWN THAT NEUROLEPTICS INHIBIT NEITHER THE REFLEX PYRAMIDAL RESPONSE, NOR THE INTRACORTICAL RESPONSE, OCCURRING IN THE MOTOR REGION IN STIMULATION OF THE FIRST SOMATOSENSORY AREA. "The Extraction-Photometric Determination of Scandium with Use of 1,5-Di-(2'-hydroxy-3', 5', 6'-trichlorophenyl)-3-acetylformazan"

Moscow, Zhurnal Analiticheskoy Khimii, Vol XXV, No 2, Feb 70, pp 267-271

**Abstract:** A number of high-sensitivity reagents proposed for use in the spectrophotometric determination of scandium (xylene orange, etc.) are not very effective in practice if thorium, zirconium or any of a number of other substances are present. In view of the high selectivity of DHTRICHAZ (expansion shown in article title) for scandium ions, the authors developed a new extraction-photometric method based on this compound.

Scandium was determined in both wolframite and tungsten samples, using DHTRICHAZ as a reagent. The scandium-reagent stoichiometric ratio was found to be 1:2; the molar extinction of the complex,  $(2.70 \pm 0.67) \cdot 10^4$  for 675 nm. The authors also suggest a quantitative method for determining scandium in tungsten, wolframite, slag and salts, based upon tests which they ran, 1/1.

"Investigation of Structural Transformations in Biomembranes by Means of the Spin-Probe Method: Temperature-Induced Changes in Bacterial Membranes"

Moscow, Biokhimiya, Vol 36, No 6, Nov/ Dec 71, pp 1149-1155

**Abstract:** To investigate changes induced in bacterial membranes by temperature changes within a physiological range, isolated and sound-disintegrated membranes of *M. lysodeikticus* and *E. coli* were mixed and incubated with the free iminoxyl radicals 1,1,3,3,7-pentaethyl-7,8-benzo-4,2,3,4-tetrahydro-pyrrolo-(3,4-beta)-indole-2-oxyl (I) and 2,2,6,6-tetramethyl-4-capryloyloxylpiperidine-1-oxyl (II) serving as indicators of structural changes. Compound I was incorporated in the protein fraction and compound II in the lipid fraction of the membranes. The correlation observed between the spin diffusion of the test molecules and the temperature indicated that structural transformations take place in both the protein and the lipid fractions. The drastic changes which take place in the membrane during the transition from 0 to 70°C

USSR

BINYUKOV, V. I., et al., Biokhimiya, Vol. 36, No 6, Nov/Dec 71, pp 1149-1155

temperatures suggest that high temperature induces conformational transformations in the protein fraction, and these induce structural transformations in the lipid fraction of bacterial membranes.

ELECTRON MICROSCOPIC STUDY OF THE SECTIONS  
OF BR. ABORTUS AND SUIS CELLS AT VARIOUS PERIODS  
OF THEIR INTERACTION WITH THE CORPUSCLES  
OF Tb PHAGE

N. N. Ostrovskaya, A. A. Manukin, T. A. Tolmacheva

In ultra-thin sections of Br. abortus and suis cells prepared after a different period of contact with corpuscular Tb phage there was revealed a principal difference in the interaction of the phage and cells of the mentioned species of brucella. Various periods of interaction of the phage and cells were revealed in the sections of Br. abortus cells: the time of adsorption, the intracellularly localized reproduced corpuscles of the phage and their exit; changes in submicroscopic structure of Br. abortus cells were also noted. Interaction of Br. suis cells with the corpuscles of Tb phage were limited by the process of adsorption. This pointed to the fact that the lysis of Br. suis cells observed in the presence of multiplicity of infection is conditioned by lysis from without.

"Electron-Microscope Study of Br. abortus and B. suis Cells at Different  
Periods of Interaction with Tb Phage Particles"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 2, 1970, pp  
76-78

Abstract: A fundamental difference was noted in the interaction of Tb phage particles with cells of the two *Brucella* species. In preparations of ultra-thin sections of *Br. abortus*, cells with adsorbed phage particles were seen after 1½-3 hours of contact. After 6-9 hours of contact, reproduced particles were clearly visible within the cells against the background of cytoplasm. There were also ultrastructural changes in the nucleus and cell wall. The effect of the phage on *B. suis* was quite different. The preparations contained phage-free, unaltered cells or cells with adsorbed particles. Experiments with several *B. suis* strains failed to reveal the presence of phage particles within the cells. Large quantities of detritus observed in several visual fields were indicative of destruction of the cells, possibly caused by "lysis from without."

"Evaluation of the Secondary Structure of Proteins of Bacterial Membranes on the Basis of Infrared Spectroscopy Data"

Moscow, Doklady Akademii Nauk SSSR, Vol 198, No 6, 1971, pp 1,457-1,460

**Abstract:** The structural organization of protein in *Micrococcus lysodeikticus* and *Escherichia coli* membranes was studied through the infrared spectroscopy of dry films and also on the basis of the H ≠ D exchange rate in moist preparations of intact and defatted membranes. The reason for the study was the small amount of information on the state of basic components of biological lipoprotein membranes. It is noted that the application of many physical methods such as nuclear magnetic resonance and infrared spectroscopy has shown that proteins in membranes of different origins are in an  $\alpha$ -spiral and disordered tangle state and that the  $\beta$ -form is apparent only under special conditions. Bacterial membranes were previously studied only in a paper by Lenard and Singer in 1966, who observed that the parameters of optical rotatory dispersion and circular dichroism of membranes of *Bac. subtilis* are very similar to the parameters for erythrocytes. This was

"Composite Strengthening of Steel by Hydroextrusion"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 4, Jul-Aug 71, pp 71-76

**Abstract:** An attempt is made to achieve high indicators of strength and ductility of structural steels by combination methods of strengthening: 1) thermomechanical treatment-strain aging of martensite and 2) treatment for an ultra-fine austenite grain-strain aging of martensite. Experiments were conducted using Cr-Ni-Si steels with a carbon content of 0.35% (steel A), 0.45% (steel B), and 0.50% (Steel C). Treatment consisted of austenization at 950°C, cooling to 850°C, rolling, water quenching, and tempering for one hour at 200°C (steel A) and 300°C (steel B). Steel C was treated to produce ultra-fine austenite by quenching from 900°C in oil, tempering for one hour at 200°C, repeated austenization in heating to 900°C at the rate of 100°C/sec, water quenching and tempering for one hour at 150 and 300°C. Deformation of the martensite at room temperature was accomplished by hydro-extrusion at pressures up to 25 kbar. From the heat treatments mentioned above the following mechanical properties were achieved.

"The Grain "Superhardness" of Chilled Steel"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 4, 1971,  
pp50-53

**Abstract:** The effect of austenite grain size on the hardness of chilled steel was experimentally investigated on specimens of steels 40 and U8, (3 x 10 x 110 mm), prepared from preliminarily improved skeleps, and of samples (28 mm in diameter) of steel 45. It is demonstrated that the hardness depends linearly on the grain size and that the phase cold hardening, determined by the rapid formation of austenite, does not result in a noticeable increase of hardness. A reliable exposure of the effect of grain size on the increase of hardness of chilled steel was found to be possible only on the basis of a grain size reduction from 7-8 to 14-15 balls with rates of 100-1000 deg/sec. A maximum Rockwell Superhardness of the ball 2 can be obtained. Three illustrations, three tables, eight bibliographic references.

"Expansion of Random Quantities and Vectors"

Razlozheniya sluchaynykh velichin i vektorov [English version above],  
Moscow, Nauka Press, 1972, 479 pages (Translated from Referativnyy  
Zhurnal - Kibernetika, No 8, 1973, Abstract No 8 V20 by G. Chistyakov)

Translation: This monograph sums up ten years of studies in the theory  
of expansion of random quantities and vectors, performed after publication  
of the well known book of Yu. V. Linnik, Razlozheniya veroyatnostnykh  
zakonov [Expansion of probabilistic laws], (RZIMat, 1973, 7V110).

Chapters I-V, VII-VIII study the same problems as in the earlier book of  
Yu. V. Linnik, much new material is included and the method used in a  
number of proofs is changed. Chapter VI contains general theorems on  
the expansions of multidimensional laws, as well as sufficient conditions  
for membership of n-dimensional limitless divisible laws in class  $I_{0n}$   
(i. e., the class of n-dimensional laws not having unexpandable components).

LINNIK, Yu. V., OSTROVSKIY, I. V., Razlozheniya sluchaynykh velichin i vektorov, Moscow, Nauka Press, 1972, 479 pages

The systematic study of the expansions of random vectors was begun basically in the 1960's and is fully reflected in this monograph for the first time. Chapter IX reflects the recently developed theory of V. M. Zolotarev of summation of independent random quantitites without conditions of limiting negligibility. Chapter X is dedicated to unsolved problems. The book includes four appendices, presenting special problems. The monograph is ended with a commentary on historical problems and references to the literature.

"The Interaction of Transverse Ultrasonic Waves With Charge Carriers  
in Piezo Semiconductor Plates"

Leningrad, Fizika Tverdogo Tela, Vol 12, No 6, June 1970, pp 1686~  
1692

Abstract: A solution is provided to the problem of the interaction  
of charge carriers with transverse ultrasonic waves which propagate  
along direction  $\langle 100 \rangle$  in a piezo semiconductor of  $C_{6v}$  symmetry.  
Research in this field has up to now not been published; therefore,  
in the article theoretical and experimental research on the influence  
of conductivity and drift fields on the propagation of transverse  
waves in plates of crystals with a symmetry of  $C_{6v}$  has been carried  
out (the problem is solved without account being taken of the diffu-  
sion of the charge carriers; the experiment was carried out on the  
basis of CdS). Dispersion equations are obtained, and from them  
1/2

USSR

KUCHEROV, I. YA., et al, Fizika Tverdogo Tela, Vol. 12, No 6, June  
1970, pp 1686-1692

the attenuation of the ultrasonic waves in the first approximation is found on the basis of the square of the coefficient of electro-mechanical coupling. For transverse waves in plates the attenuation may be represented in the form of a product from an analogous expression for a limitless crystal and a value  $A$ , which depends on the parameters of the plates, the frequency, and the drift fields. Far from the points of origination of nonzero modes (when the phase velocity of the waves  $v$  approaches the velocity of the transverse waves in a boundless crystal  $v_t$ )  $A$  approaches 1. Close to the point of origination  $A \approx v/v_t$ . For a null symmetrical mode  $A$  may change from zero to unity. A comparison of the theoretical results with the experimental ones is made. The experiment was performed on CdS plates. The experimental and theoretical details on electron attenuation are in satisfactory agreement, while the data on the dependence of attenuation upon the drift fields agree only qualitatively.

Gor'kiy, Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika, Vol XV, No 2,  
1972, pp 242-248

Abstract: Results are presented from a study of nonlinear phenomena caused by the self-modulation effect in lines with nonlinear capacitances of the semiconductor diodes. The effects connected with instability of the traveling and standing electromagnetic waves in these lines were investigated. In such systems it turned out to be possible to obtain highly significant (up to 13 times) buildup of the depth of modulation of the traveling wave and also to trace the evolution of the waves with deep modulation as a result of which the wave splits into shortwave packets. It is also essential that the use of a limited system — resonator — permits observation of the self-modulation of the standing monochromatic wave. The modulation occurs only as a result of natural field fluctuations. The specific nature of the system used in the experiment connected with the relaxation nature of the nonlinearity is also presented. The investigated effects can find practical application in connection with the possibility of amplifying and generating electromagnetic signals [L. A. Ostrovskiy, et al., USSR Author's Certificate No 302801, Byull. izobr., No 15, 1971].

"A Device for Realizing n-Place Logic Functions of the Form  $F_k = (x_1 x_2 x_3 \dots x_k) + (x_1 x_2 x_k \dots x_n)$  of  $C^k$  Combinations of Variables"

Moscow, Otkrytiya, Izobreteniya, Promyshlennye Obraztsy, Tovarnyye Znaki, No 12, 1970, Author's Certificate No 257186, p 118

**Abstract:** This Author's Certificate introduces a device for realizing n-place logic functions of the form  $F_k = (x_1 x_2 x_3 \dots x_k) + \dots + (x_1 x_2 x_k \dots x_n)$  of  $C^k$  combinations of variables. The device contains a converter which changes the input combinations of variables to an algebraic sum, a block of constants, and comparison elements. As a distinguishing feature of the patent, the system is simplified while simultaneously realizing all n-dimensional functions of the given type. The output of the unit which converts the input combinations of variables to an algebraic sum is connected to the comparison elements, to which the outputs of the block of constants are also connected. The outputs of the comparison elements act as the outputs of the entire device.

SOME PECULIARITIES OF THE SYNAPTIC TRANSMISSION  
BETWEEN PHOTORECEPTORS AND HORIZONTAL CELLS

Yu. A. Trifonov, M. A. Ostrovskiy

Institute of Problems of Information Transmission  
and Institute of Higher Nervous Activity and Neurophysiology,  
Academy of Sciences, USSR, Moscow

Summary

A hypothesis, according to which the transmitter depolarising the horizontal cell membrane is continually liberated from the receptors in darkness and ceases to be liberated in the light, is tested experimentally. The results described in the first part show that current passing radially through the retina (anod on the receptor surface) and evoking the positive (depolarizing) response of the horizontal cells acts on the presynaptic endings of receptors. As a result they become depolarized and the transmitter is liberated from the receptors endings. The experiments with electric stimulation of

1/2

2

REEL/FRAME  
19771030

AP0044411

the retina showed that potassium cyanide breaks the synaptic transmission from the receptors to the horizontal cells (part II). The membrane potential in this case is equal to membrane potential in the bright light and it seems to be the true resting potential of horizontal cells. The stability of the light membrane potential of the horizontal cells in the case of temperature changes supports this suggestion (III part). At the same time the membrane potential in the darkness can be greatly increased by heating. This effect was explained by an increase in the speed of destruction of the transmitter, because the increase of temperature shortens the response of horizontal cells to electric stimulation.

"Effectiveness of the Use of Certain Insecticides Against Turnip Moth Caterpillars on Solanum Laciniatum Ait. Plantings"

Moscow, Khimiya v Sel'skom Khozyzystve, Vol 8, No 7, Jul 70, pp 31--32

**Abstract:** Studies were conducted of the effectiveness of certain insecticides against turnip moth caterpillars on young Solanum laciniatum Ait. crops, a source of steroid hormones in the USSR. Under hot and dry climate conditions, the succulent Solanaceae family plants attract turnip moth caterpillars and contribute to their development. One of the reasons for the inadequate effectiveness of organochlorine preparations in pest control is loss of their toxicity under high temperature and active solar radiation conditions. Granular preparations are more resistant to meteorological factors and less dangerous for entomophages and pollinating insects than dusts. Therefore, to protect the plants against the turnip moth caterpillars during the course of vegetation, granular insecticides were used. To prevent early damage to shoots, the intoxica-

1/2

- 60 -

USSR

LI, N., et al., Moscow, Khimiya, v Sel'skom Khozyaystve, Vol 8, No 7, Jul 70, pp 31-32

tion method was applied.

It was found that preplanting powdering of seeds with aldrin contributed to an 85.8% decrease in shoot damage, and with heptachlor and the gamma-isomer of hexachlorocyclohexane it was 23.5% and 19.1% respectively. Such a level of damage decrease under brief intoxication is clearly inadequate; therefore, the preplanting powdering of the plants in the system of control measures for the turnip moth caterpillar can only be considered as a supplementary one. The low effectiveness of powdering, probably, can be explained by the poor adherence of the insecticides on the smooth and fine Solanum seeds. In belt-type row application of the granular insecticides, the amount of damaged and lost plants dropped by 94-95% in comparison with control plants. Application of diazinon in half dose only partly protected the young crops from pest damage. Unsatisfactory results were also obtained in spraying of the young crops with a diazinon suspension.

IX-1. PHYSICO-CHEMICAL STUDIES OF THE PROCESSES OF GROWING AND ALLOYING CdP CRYSTALS IN A CLOSED GAS TRANSPORT SYSTEM

(Article by A. V. Sushilova, P. I. Ostrovskiy, I. V. Ruzenitsina; III Station, 12-17 June 1977, p. 17)

An analysis was made of the growth conditions of single CdP crystals in Cd, Pb, Pt, Zn, Cd and Cu admixtures.

A study was made of the effect of the admixtures on the morphology of the grown CdP crystals. In particular, Cu and Cd admixtures promote the growth of high-resistance ( $> 10^9$  ohm) acicular crystals in the cilia direction; the apex is a three-sided prism with smooth faces (111); the basal faces are parallel to the <110> direction. The crystals attain 10-15  $\mu$  in size. Crystals of the dendritic type with a growth direction from Pt are six-sided (111). In the Cd-Zn and Cd systems under the conditions of growth (Pt = 300-400°; temperature allowed crystals are grown to  $\sim 3.5 \cdot 10^{-3}$  cm<sup>3</sup>) gradients offered the possibility of establishing the relation between the initial concentration of zinc and its concentration in the vapor and condensed phases for various temperatures and quantities of the transporting agent.

Pharmacology and Toxicology

USSR

OSTROVSKIY, ROMAN, NOVOST: News Agency

"New Drugs"

Riga, Sovetskaya Latviya, 13 Jan 70, p 4

Abstract: Of the five thousand species of plants entered into the inventory lists compiled by Tadzhik botanists, many contain physiologically active substances. Among these substances alkaloids are of importance. While highly effective from the standpoint of pharmacological application, alkaloids have a considerable toxicity. This toxicity can be reduced by preparing derivatives of the alkaloids, thereby expanding the range of application of the alkaloids in medicine. The Laboratory of the Chemistry of Naturally Occurring Compounds of the Institute of Chemistry, Academy of Sciences Tadzhik SSR, is conducting work along these lines. One of the promising chemically modified alkaloids is beralin, a chloro derivative of berberine. The toxicity of beralin is many times lower than that of berberine, while its activity as a cholagogue is the same. New drugs derived from ephedrine, cytisine, and other alkaloids have also been synthesized

1/2

USSR

OSTROVSKIY, ROMAN, Sovetskaya Latviya, 13 Jan 70, p 4

at the laboratory mentioned. An example is glycyllcytisine, which has a toxicity 20 times lower than that of the initial alkaloid also applied as a spasmolytic. Research has been initiated on combining alkaloids with amino acids. One may assume that alkaloids, being substances foreign to cells of the living body, damage the membranes of the cells in the process of penetration into the latter. This presumably is the reason for the toxicity of alkaloids. On being combined with an amino acid, an alkaloid (e.g., papaverine) will acquire, to a certain extent, properties similar to those of substances which are normally assimilated by cells of the organism. Consequently, the damage to cells and the toxicity of the alkaloid will be reduced.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. OF THE FIVE THOUSAND SPECIES OF PLANTS ENTERED INTO THE INVENTORY LISTS COMPILED BY TADZHIK BOTANISTS, MANY CONTAIN PHYSIOLOGICALLY ACTIVE SUBSTANCES. AMONG THESE SUBSTANCES ALKALOIDS ARE OF IMPORTANCE. WHILE HIGHLY EFFECTIVE FROM THE STANDPOINT OF PHARMACOLOGICAL APPLICATION, ALKALOIDS HAVE A CONSIDERABLE TOXICITY. THIS TOXICITY CAN BE REDUCED BY PREPARING DERIVATIVES OF THE ALKALOIDS, THEREBY EXPANDING THE RANGE OF APPLICATION OF THE ALKALOIDS IN MEDICINE. THE LABORATORY OF THE CHEMISTRY OF NATURALLY OCCURRING COMPOUNDS OF THE INSTITUTE OF CHEMISTRY, ACADEMY OF SCIENCES TADZHIK SSR, IS CONDUCTING WORK ALONG THESE LINES. ONE OF THE PROMISING CHEMICALLY MODIFIED ALKALOIDS IS BERALIN, A CHLORD DERIVATIVE OF BERBERINE. THE TOXICITY OF BERALIN IS MANY TIMES LOWER THAN THAT OF BERBERINE, WHILE ITS ACTIVITY AS A CHOLAGOGUE IS THE SAME. NEW DRUGS DERIVED FROM EPHEDRINE, CYTISINE, AND OTHER ALKALOIDS HAVE ALSO BEEN SYNTHESIZED AT THE LABORATORY MENTIONED. AN EXAMPLE IS GLYCOCYLTISINE, WHICH HAS A TOXICITY 20 TIMES LOWER THAN THAT OF THE INITIAL ALKALOID ALSO APPLIED AS A SPASMODIYTIC. RESEARCH HAS BEEN INITIATED ON COMBINING ALKALOIDS WITH AMINO ACIDS. ONE MAY ASSUME THAT ALKALOIDS, BEING SUBSTANCES FOREIGN TO CELLS OF THE LIVING BODY, DAMAGE THE MEMBRANES OF THE CELLS IN THE PROCESS OF PENETRATION INTO THE LATTER. THIS PRESUMABLY IS THE REASON FOR THE TOXICITY OF ALKALOIDS.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. OF THE FIVE THOUSAND SPECIES OF PLANTS ENTERED INTO THE INVENTORY LISTS COMPILED BY TADZHIK BOTANISTS, MANY CONTAIN PHYSIOLOGICALLY ACTIVE SUBSTANCES. AMONG THESE SUBSTANCES ALKALOIDS ARE OF IMPORTANCE. WHILE HIGHLY EFFECTIVE FROM THE STANDPOINT OF PHARMACOLOGICAL APPLICATION, ALKALOIDS HAVE A CONSIDERABLE TOXICITY. THIS TOXICITY CAN BE REDUCED BY PREPARING DERIVATIVES OF THE ALKALOIDS, THEREBY EXPANDING THE RANGE OF APPLICATION OF THE ALKALOIDS IN MEDICINE. THE LABORATORY OF THE CHEMISTRY OF NATURALLY OCCURRING COMPOUNDS OF THE INSTITUTE OF CHEMISTRY, ACADEMY OF SCIENCES TADZHIK SSR, IS CONDUCTING WORK ALONG THESE LINES. ONE OF THE PROMISING CHEMICALLY MODIFIED ALKALOIDS IS BERALIN, A CHLORO DERIVATIVE OF BERBERINE. THE TOXICITY OF BERALIN IS MANY TIMES LOWER THAN THAT OF BERBERINE, WHILE ITS ACTIVITY AS A CHOLAGOGUE IS THE SAME. NEW DRUGS DERIVED FROM EPHEDRINE, CYTISINE, AND OTHER ALKALOIDS HAVE ALSO BEEN SYNTHESIZED AT THE LABORATORY MENTIONED. AN EXAMPLE IS GLYCICYLCYTISINE, WHICH HAS A TOXICITY 20 TIMES LOWER THAN THAT OF THE INITIAL ALKALOID ALSO APPLIED AS A SPASMODIATIC. RESEARCH HAS BEEN INITIATED ON COMBINING ALKALOIDS WITH AMINO ACIDS. ONE MAY ASSUME THAT ALKALOIDS, BEING SUBSTANCES FOREIGN TO CELLS OF THE LIVING BODY, DAMAGE THE MEMBRANES OF THE CELLS IN THE PROCESS OF PENETRATION INTO THE LATTER. THIS PRESUMABLY IS THE REASON FOR THE TOXICITY OF ALKALOIDS.

ABSTRACT/EXTRACT--ON BEING COMBINED WITH AN AMINO ACID, AN ALKALOID (E.G., PAPAVERINE) WILL ACQUIRE, TO A CERTAIN EXTENT, PROPERTIES SIMILAR TO THOSE OF SUBSTANCES WHICH ARE NORMALLY ASSIMILATED BY CELLS OF THE ORGANISM. CONSEQUENTLY, THE DAMAGE TO CELLS AND THE TOXICITY OF THE ALKALOID WILL BE REDUCED.

241486 THERMAL STRAIGHTENING OF THINWALLED PINNED CYLINDERS reduces residual strain by heating the peripheral parts of the fins and outer case of the cylinder to 300-350°C to cope with alloy steel blanks. The thinwalled, split turbine low pressure cylinder has its peripheral fin parts heated as stated and once the peripheral zone has heated through and the outer case, forces begin to operate from inside in the bolt bores joining the cylinder and these produce a moment which bends each half of the cylinder relative to an axial plane perpendicular to the horizontal joint plane and in a direction opposite to the bend which occurs during the primary deformation of the cylinder. Thus this moment restores the concentricity.

"Study of Nuclear Magnetic Resonance in  $Gd_x Y_{1-x} Fe_2$  Compounds"  
Moscow, Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 65, No 2 (8),  
1973, pp 693-697

Abstract : The nuclear magnetic resonance spectra were measured on gadolinium and yttrium nuclei in  $Gd_x Y_{1-x} Fe_2$  compounds at a temperature of 77° K. The contributions to the hyperfine fields in the gadolinium and yttrium nuclei on the part of the nearest neighbors of the gadolinium atom sublattice were evaluated. The primary contribution to the hyperfine fields in yttrium and gadolinium is made by the iron atom sublattice.

The variation of the position of the center of gravity of the nuclear magnetic resonance spectra of gadolinium and yttrium as a function of the atomic concentration of gadolinium and the variation with temperature, of the nuclear magnetic resonance of  $Gd^{155}$  in  $GdFe_2$  and  $Y^{89}$  in  $YFe_2$  are plotted. A table is presented for the probability of replacement of the nearest Cd atoms by a Y atom and the experimental procedure for obtaining and recording the 1/2

nuclear resonance spectra is described in detail. The dependence on composition and temperature of the nuclear magnetic resonance of Gd<sup>155</sup>, Gd<sup>157</sup>, and Y<sup>89</sup> is determined both by the iron and gadolinium sublattices.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. GLYCEROL, SILICONES, AND EUTETIC  
MIXTS. OF MOLTEN SALTS WERE INVESTIGATED AS HEAT TRANSFER MEDIA IN THE  
VULCANIZATION BATH FOR PROCESSING RUBBER CONTG. CARBOXYL GROUPS WITH  
DIISOCYANATES. THE FILMS OBTAINED CAN BE APPLIED AS PRIMERS OR COATINGS  
FOR THE OUTER PARTS OF FOOTWEAR. FILMS VULCANIZED IN EUTECTIC MIXTS.  
HAD THE BEST PROPERTIES (HIGH STABILITY, SMALL SWELLING IN ETOAC).  
SILICONE PRODUCTS CAN BE USED, BUT WITH LIMITATIONS; GLYCEROL REACTS  
WITH A CONSIDERABLE AMT. OF DIISOCYANATE. THE HYDROPHILIC PROPERTIES OF  
FILMS WERE GREATER WHEN THE SAMPLES WERE VULCANIZED IN A WATER SOL. HEAT  
TRANSFER MEDIUM.
