"Results of a Study of Volatility and Speed of Hydrolysis of Methylnitrophos,  
Metathion, and Sumithion in Various Media"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 10, No 2, (100), 1972, pp 39-42

**Abstract:** For studying the volatility of preparations a prepared surface is analyzed throughout determined time intervals. Glass, green leaves, wax paper, etc. are commonly used as substrates. Petri dishes were used by the author. 7.4 mg methylnitrophos and 10 mg each of metathion and sumithion were dissolved per ml of acetone. A 20% emulsion concentrate (starch equivalent) of methylnitrophos and 50% concentrate emulsions of metathion and sumithion were used. The volatility of these three compounds was shown to depend upon climatic conditions. Methylnitrophos was shown to hydrolyze more weakly in acidic and neutral media than in alkaline media.

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 10, No 2 (160), 1972, pp 39-42

**Abstract:** For studying the volatility of preparations a prepared surface is analyzed throughout determined time intervals. Glass, green leaves, wax paper, etc are commonly used as substrates. Seven, four mg methylnitrophos and 10 mg each of metathion and sumithion were dissolved per each ml of acetone. A 20% emulsion concentrate (starch equivalent) of methylnitrophos and 50% concentrate emulsions of metathion and sumithion were used. The volatility of these three compounds was shown to depend upon climatic conditions. Methylnitrophos was shown to hydrolyze more slowly in acidic and neutral media than in alkaline media.

Tr. 2-g0 Vses. soveshch. po issled. ostatkov pestitsidov i profilakt. zagryazneniya imi produktov pitaniya, kormov i vnesh. sredy (Works of the Second All-Union Conference on Investigation of Residues of Pesticides, and Prevention of Pesticide Contamination of Foodstuffs, Fodder and the External Environment), Tallinn, 1971, pp 337-344 (from RZh-Khimiya, No 11, Jun 72, Abstract No 11N412)

Translation: The nature of the substrate, the mechanism of action of the pesticide and the nature of the toxic residue determine the selection of the method of extracting a pesticide from plant matter. Steam distillation extraction in the Soxhlet apparatus, homogenization and cold agitation are used. The last method is recommended for organochlorine and organophosphorus compounds. Sublimation under vacuum and distribution between two solvents are used for purifying extracts.

Sumitione on the Leaves, Branches and Fruit of Apple Trees in  
Moldavia".

Moscow, Khimiya v sel'skom khozyaystve, No 11, 1971, pp 35-37

Abstract: A study is described of the dynamics of the residue of the Soviet-made insecticide methylnitrophos and the foreign preparations metatione and sumitione. The tests were conducted under both laboratory and field conditions. All three preparations are shown to have retained their toxic properties on the leaves and branches of the apple trees for 10-15 days. Accordingly, the suggested intervals between sprayings of these preparations against San Jose scale and apple worm are 10-15 days; when sprayed for the apple leaf miner, the suggested interval is 8-10 days. A check for insecticide residues on apples conducted 20 days after spraying revealed 0.3-0.7 mg/kg methylnitrophos, 0.5-2.0 metatione

Translation: For extraction of figon (I) from grape leaves, grapes or apples,  $C_5H_6$  or  $CHCl_3$  is used. The extract is purified by microsublimation at  $100^\circ$  and 1 mm Hg; it is dissolved in acetone or  $CHCl_3$  and analyzed by the method of thin-layer chromatography, colorimetric or spectrophotometric methods at 340 nm. The thin-layer chromatographic analysis is performed in silicic acid reinforced with gypsum, in the cyclohexane- $CHCl_3$  system (7:3), and it is developed by  $Et_2NH$ . The sensitivity of the method is 0.05-0.01 mg/kg. The sensitivity of the colorimetric method with  $Et_2NH$  is 0.25 mg/kg, the degree of detection of I is ~70%, the relative error in the analysis is  $\pm 4\%$ . The sensitivity of the spectrophotometric method was 50 γ of I in the sample.

## POLYNOMIAL ALGORITHMS OR THE THEORY OF STATISTICAL SUFFICIENCY AS APPLIED TO CLASS RECOGNITION PROBLEMS

PART II: 50-3783-553-2

6 NOV 1972

[Article by A. G. Ivashchenko, Yu. I. Saven, V. N. Mironov, A. M. Slobodchikov, I. Z. Patraty, V. V. Vasil'ev, V. V. Vinogradov, S. N. Vinogradova, B. P. Vinogradov, and V. V. Vinogradova. Translated from *Voprosy Kibernetiki*, No. 1, 1972, pp. 10-17.]

The theory of statistical solutions is the structural abstraction for patterns or classes recognition implementing the idea of information accumulation. In classical form, this theory is polymeric in the sense that it is based on a single function of the risk function with respect to three cofactors: the matrix of a priori probabilities, the experimental matrix and the loss matrix. These three matrices can be called "complete," since they consider all the arguments directly, and for dependent arguments, all their covariations, which requires quite broad initial data for strict observation of stationarity of the process.

In accordance with the basic ideas of the "Method of Group Consideration of Arguments" (see the Ukrainian Journal Automation, 1969-1970), it is proposed that the "polymeric" complete algorithm be replaced by a system of several series of "partial" descriptions for all possible pairs of arguments. For training each of the "partial" algorithm it is sufficient to have a corresponding short series of experimental data available, and the remaining elements of the complete description can be obtained from a system of partial descriptions by exclusion of intermediate variables.

The complete description (algorithm) has the known form:

$$\rho(j) = \Sigma_i p(u_j|R_i) R_i \circ (x_1, \dots, x_n/R_i), \quad (1)$$

where  $p(u_j|R_i)$  is the decision-making risk;  $R_i$  is the a priori probability of the clause;  $x_i$  is the solution in favor of the  $j$ -th clause;

$x_1, \dots, x_n$  are discrete arguments ( $x_i = 1, 2, \dots, q$  where  $q$  is the number of digitalization levels);

"Recognizing the Lethal Duration and Content of Pesticides in Plant  
According to a Probability Algorithm for a Method of Data Handling by  
Groups"

Kiev, Avtomatyka, No 5, Sep-Oct 70, pp 42-52

Abstract: The article describes the development of a probability al-  
gorithm for a method of data handling by groups which uses the numerator  
of the Bayes formula or its modification as a support function. The  
probability algorithm is used to solve the following problem:

- 1) Approximately determining the time constant in the exponent  
in the expression for a pesticide's toxicity on the basis of data con-  
cerning the physicochemical properties of the preparation, the conditions  
of its use, and plant peculiarities;

"Mathematical Forecasting of the Degradation Time of Pesticides in Plants by the Probability Algorithms of the Grouped Argument Method"

Moscow, Gigiiena Sanitariya, No 10, 1972, pp 43-48

**Abstract:** A study was made of one of the elements of a generalized mathematical model reflecting the multifactor dependence of the process of propagation and disappearance of pesticides in various parts of the environment with indication of forecasting the degradation time of the pesticides in plants. A set of pesticides was divided into classes with respect to duration of their degradation the function of 22 attributes including the physical-chemical properties, parameters characterizing the crop and the conditions of applying the pesticide to it, and also of the meteorological conditions. Three digitalization levels were introduced, and simple recognition formulas were obtained which can be used for manual calculations and to discover the pesticide dynamics in the case of multiple combination of the indicated factor with an accuracy up to 80%. The recognition formula in the logarithmized form appears as follows:

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE LUMINESCENCE OCCURRING DURING CONTRACTION, ELONGATION, AND FAILURE OF POLYMERS WAS STUDIED ON A SNK-7 IKHF APP. EQUIPPED WITH PHOTOMULTIPLIERS FEU-29 (LAMBDA SUBMAX EQUALS 400 PLUS OR MINUS 40 MMU), FEU-13 (LAMBDA SUBMAX EQUALS 410 PLUS OR MINUS 10 MMU), AND FEU-22 (LAMBDA SUBMAX EQUALS 750 PLUS OR MINUS 100 MMU). A CROSS SECTIONAL DIAGRAM OF THE APP. AND ITS MODE OF OPERATION ARE PRESENTED. THE MOST INTENSIVE LUMINESCENCE DURING FAILURE WAS OBSD. IN POLY (TETRAFLUOROETHYLENE) FP-4 (I) AND POLY(ETHYLENE TEREPHTHALATE) (III) FILMS; THE LEAST LUMINESCENT POLYMERS WERE HIGH PRESSURE POLYETHYLENE, ETHYLENE PROPYLENE COPOLYMER (III), ETHYLENE ALPHA BUTYLENE COPOLYMER, POLY(VINYL CHLORIDE), POLYPROPYLENE, AND NATURAL RUBBER (IV) VULCANIZATES. FAILURE OR SUDDEN CONTRACTION IN I-IV FILMS WAS ACCCOMPANIED BY POST LUMINESCENE, (GREATER THAN OR EQUAL TO 15 MIN). THE LUMINESCENE INTENSITY WAS LOW IN ALL CASES AND EXCEEDED THE SENSITIVITY THRESHOLD OF THE PHOTOMULTIPLIERS ONLY BY A FACTOR OF 10 PRIME2-10 PRIME3. A HYPOTHESIS WAS ADVANCED TO ACCOUNT FOR THE LUMINESCENCE. STUDY OF THERMAL LUMINESCENCE OF POWD. POLYMERS SUGGESTED THAT LUMINESCENCE IN POLY (ME METHACRYLATE) AND POLYSTYRENE AT 270-330DEGREESK WAS DUE TO RECOMBINATION OF PEROXIDE RADICALS FORMED DURING MECH. SCISSION OF MACROMOLS., WHEREAS INTENSIVE LUMINESCENCE ABOVE 330DEGREESK WAS DUE TO OXIDATIVE THERMAL DEGRADATION INITIATED BY DECOMPO. HYDROPEROXIDES.

"Survival and Physiological Activity of Some Yeast Strains Studied After a Prolonged Storage in Silica Gel"

Moscow, Mikrobiologiya, Vol 41, No 1, Jan/Feb 72, pp 164-167

Abstract: Yeast cultures of *Candida guilliermondii*, *C. tropicalis*, and *C. lypolitica* were used in the study. The 24-hour cultures of yeast were mixed with silica gel or with silica gel containing one of the following compounds: 10 milligrams/liter of  $\text{FeSO}_4 \cdot 7 \text{ H}_2\text{O}$  or  $\text{MnSO}_4 \cdot 7 \text{ H}_2\text{O}$ , or 6 milligrams/liter of  $\text{ZnSO}_4 \cdot 7 \text{ H}_2\text{O}$ ,  $\text{CoCl}_2 \cdot 6 \text{ H}_2\text{O}$ ,  $\text{NH}_4\text{NO}_3$ , or  $(\text{NH}_4)_2\text{MoO}_4$ . The mixtures were dried and stored in sealed ampules for 1, 6 or 12 months at room temperature. The yeast survived in all mixtures, but the mixtures of silica gel containing  $\text{FeSO}_4$  or  $\text{MnSO}_4$  gave the best survival and retained best their capability to oxidize carbohydrates even after one year of storage, which indicated that their oxidizing function was preserved.

## IN VITRO MATURATION OF THE HUMAN OVUM

UDC: 611-013.16-085.2

JPRS 55569  
29 Mar 72

Article by M.A. Patrikian-Malikov, A.P. Drbin, N.A. Samoilova,  
Institute of Obstetrics and Gynecology, USSR Academy of  
Medical Sciences, and Institute of Experimental Medicine, USSR Academy of  
Medical Sciences, Leningrad; Moscow, Vestnik Akademii Meditsinskikh Nauk SSSR,

Russian, No. 2, 1972, pp. 60-65]

Cytogenetic investigations of human sex cells are of substantial interest both to theoretical and clinical medicine. We know that some congenital pathological states (for example, Down's, Sherrington-Kent-Turner, Klinefelter's syndromes, and others) are determined by numerical chromosomal aberrations arising in parental sex cells when chromosomes do not separate in meiosis or splitting of the zygote (Carr, 1965; Lejeune et al., 1959; Lejeune et al., 1960). It was also shown that a considerable number of spontaneous miscarriages is related to chromosomal aberrations formed with nonseparation of chromosomes in meiosis or splitting of the zygote (Carr, 1965; N.P. Bochvar and N.S. Stenova, 1969). In the presence of diseases associated with prolonged fertility (Stein-Leventhal syndrome) impaired maturation of the ovum and degenerative changes therein were demonstrated (A.I. Sikitin and N.A. Samoilova, 1969, 1970).

Thus, investigation of maturing sex cells brings us closer to understanding the mechanism of chromosome pathology, miscarriages, and some forms of fertility in man.

In addition, one can clearly demonstrate different types of chromosomal anomalies (for example, translocations, inversions, and others) in the somatic chromosomes of sex cells, which are unnoticeable when analyzing mitotic chromosomes of blood cells and other somatic tissues. In such cases, chromosomal aberrations would permit detection of carriers of value.

If it is not surprising that contemporary cytogenetics is concentrating on the study of human sex cells (Carr, 1969; A.A. Prokof'yeva-Bel'govskaya,

PATRUGIN, Yu. A.**"Measurement of Qualitative Characteristics"**

Modelir. Sots. Protsessov [Modeling of Social Processes -- Collection of Works], Moscow, Nauka Press, 1970, pp 103-118 (Translated from Referativnyy Zhurnal Kibernetika, No 3, 1971, Abstract No 3 V574 by M. Chelyshev).

Translation: Each phenomenon or object in the material world is perceived and recognized as a set of defined properties and characteristics differentiating it from other phenomena and objects. Four types of characteristics can be differentiated. For example, such characteristics as the form of geometric figures have discrete and disordered sets of manifestations. An example of a discrete and ordered characteristic can be found in the prices of objects for sale. Continuous and disordered characteristics include colors as physiologically perceived. Finally, continuous, ordered characteristics include most physical values and many social and psychological characteristics. Measurement itself concerns only ordered characteristics. Historically, measurement techniques have been developed and improved as applicable to additive characteristics, i. e., characteristics for which the operation of natural addition is defined, allowing any two intensities of a characteristic to be combined according to a certain rule to produce

a third intensity such that its numerical expression is equal to arithmetic sum  
of the numerical expressions of the initial intensities. For nonadditive charac-  
teristics, the only initial material for scaling is the set of empirical order  
relationships produced using a comparing device for various pairs of intensities.  
An attempt is made to present a mathematical interpretation of the problem of  
measurement. The method of arbitrary scales used to measure nonadditive charac-  
teristics in practice is studied.

239684 MULTICOLOUR FERROGRAPHIC RECORDING OF  
INFORMATION. Signals of different wave-  
length are used for developing the magnetic powder.  
The signals are modulated according to the colour  
of the transmitted picture. There are two inputs  
for the incoming signals. Each input has a colour  
sensitive inverter. The modulated signals are  
applied to the ferrite powder on a rotating drum  
and the images are transferred on to paper unwinding  
from a reel.

"Fluctuations in the Field of a Laser Beam Propagating Through a Turbulent  
Atmosphere"

Gor'kiy, IVUZ Radiofizika, Vcl. 15, No 6, 1972, pp 865-872

**Abstract:** The paper is a continuation of research utilizing the Kolmogorov spectrum of fluctuations in the index of refraction to calculate the statistical characteristics of the amplitude and phase of a laser beam field. Results are presented from a numerical analysis of the dispersion, and the correlational and structural functions of fluctuations in the logarithm of the amplitude and phase of the field in the cross section of a laser beam propagating in a turbulent atmosphere as a function of the dimensions of the emitter, the conditions of radiation focusing, and the coordinates of the points of observation. The authors thank S. I. Tuzova and S. N. Belovitskiy for assistance with the computations.

"Corrosion of Powder Metallurgy Titanium in a Damp Atmosphere Containing  
Hydrogen Chloride and in Solutions of Hydrochloric Acid"

Moscow, Metallurgiya i Khimiya Titana (Institut Titana), Metallurgiya  
Publishing House, Vol 6, 1970, pp 105-111

Translation: The corrosion behavior of powder metallurgy titanium in gases and solutions of hydrochloric acid within the temperature interval 20-80°C is investigated. It is established that at a temperature of 20°C, atmospheric corrosion of powder metallurgy titanium above 3 and 7% solutions of hydrochloric acid is not observed, and in a solution of hydrochloric acid with a concentration up to 10%, slight corrosion is observed after a certain induction period. At 80°C, powder metallurgy titanium corrodes with all concentrations of hydrochloric acid that were studied. The effective energy for activating the process of dissolving titanium specimens is 62.8-71.2 kilojoules per mole. Seven illustrations, one table, and 11 bibliographic entries.

"On the Ecology and Taxonomy of the Flies *Titanopteryx maculata* Mg. and  
*Schoenbaueria pusilla* Fries. (Diptera, Simuliidae) in the Ob' River Basin"

Leningrad, Entomologicheskoye Obozreniye, Vol 50, No 4, 1971, pp 770-779

Abstract: This article discusses some of the results of a study of the ecology  
and taxonomy of bloodsucking flies in the upper, middle, and lower regions of  
the Ob' River and its tributaries; observations were carried out from 1959 to  
1965 by associates of the author's institute.

It was established that the most widely distributed and malicious bloodsuckers  
are the spotted fly (*Titanopteryx maculata* Mg.), which is found everywhere  
from the tundra to the Salair foothills, and the tundra fly (*Schoenbaueria*  
*pusilla* Fries.), which is found in the forest tundra, taiga, and forest steppes.  
The former species inhabits only the Ob' and its major tributaries, such as the  
Irtysh and Chulyym, but the latter is also found in average-size rivers, such  
as the Yuksa, Chichka-Yul, and so on.

1/2

USSR

PATRUSHEVA, V. D., Entomologicheskoye Obozreniye, Vol 50, No 4, 1971, pp 770-779

Both species, which are ordinarily found together, produce one generation per year. As one proceeds from the upper to the lower Ob' basin, the emergence of Sch. pusilla Fries. shifts from the beginning of June to the end of June. In each case, the first flight of T. maculata Mg. occurs from a few days to about two weeks later. In both species, the mass flight and attack period lasts a little less than one month.

Morning and evening peaks of activity were observed for Sch. pusilla Fries., but T. maculata Mg. was active throughout the day, as it was the more heat- and light-loving of the two species.

Finally, with respect to the taxonomy of the flies, the spotted fly found in the Ob' region is believed to be the subspecies T. maculata maculata Mg. The species Sch. pusilla Fries. is a heterogenous one; a great deal of intraspecies variability in the structure of the genitalia of the male flies was observed.

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 4, Apr 71,  
p 7 11

**Abstract:** North Asian tickborne rickettsiosis which was initially identified in Krasnoyarsk Kray in 1936, still occurred there in 1967, with a distribution exceeding that in any other part of the USSR. From 1936 to 1967, 10,634 cases of this disease were recorded in Krasnoyarsk Kray. The highest incidence of the disease was in the 30 south-eastern rayons. Children younger than 16 yrs were mainly affected (61.3% of cases). The principal vector of the disease was *D. nuttalli*. The agent (*D. sibiricus rickettsiae*) was isolated for the first time from *I. persulcatus* and *H. concinna*. The most effective methods of detecting *D. sibiricus rickettsiae* in ticks were by immunofluorescence tests and tissue culture methods. Comparison of results obtained by various test methods showed that epidemiological data pertaining to exposure of the popula-

"Method of Electrochemical Deposition of a Selenium Alloy"

USSR Author's Certificate No 314818, filed 28 Mar 70, published 2 Nov 71 (from  
RZh-Khimika, No 12, Jun 72, Abstract No 12L335P)

Translation: A procedure has been patented for electrochemical deposition of a Se alloy from an electrolyte containing selenic acid. The procedure is distinguished by the fact that in order to obtain a uniform film of a Se-Bi alloy, Bi nitrate and HNO<sub>3</sub> are introduced into the electrolyte, and the process takes place at room temperature,  $D_c$  1-20 mA/cm<sup>2</sup>. The electrolyte contains (in g/liter): H<sub>2</sub>SeO<sub>3</sub> 0.5-15, Bi(NO<sub>3</sub>)<sub>2</sub> 1-53, HNO<sub>3</sub> 188-189. Se-Bi alloy with semiconductor properties is obtained by the proposed procedure.

"Electron-Microscope Study of Excess-Phase Precipitation in the Deformation of  
Alloy 36NKhTYu"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 8, Aug 73,  
pp 16-19

**Abstract:** The structural properties of alloy 36NKhTYu containing (in %): 0.04 C, 1.1 Mn, 0.36 Si, 36 Ni, 12-13 Cr, 3 Ti, 1.2 Al, balance-Fe, were studied in relation to degree of deformation and tempering mode. Strip samples 0.15 mm thick were water quenched from 1100°C, rolled with a high degree of reduction (50-70%), and tempered at 600-750°C for two hours. It was found that decomposition of the solid solution in the alloy with precipitation of the metastable gamma'-phase ( $\text{NiFe}_3$ ) ( $\text{TiAl}$ ) with an FCC lattice starts even in the deformation process: at 50% primarily along the grain boundaries and at 70% -- in the grain volume. Decomposition of the solid solution when deformed at 600-650°C is characterized by discontinuous precipitation along the grain boundaries and in 1/2

INTRAVENOUS AND INTRASPLENIC RADIOPORTOGRAPHY  
IN PATIENTS WITH PORTAL HYPERTENSION

M. D. Pal'stora, T. F. Belinskaya, Yu. A. Yershov

Summary

Intravenous radioportography (determination of the cardioportal time) was carried out in 78 patients with portal hypertension. The investigations have shown that intravenous radioportography in combination with other techniques is perspective in the diagnosis of portal hypertension. However, it not always make it possible to evaluate the form of portal hypertension, inasmuch as changes of the cardioportal time mainly depend on the degree of obstruction of the portal system and the development of collateral circulation.

Intrasplenic radioportography was done in 16 patients with renal hypertension. The latter technique is perspective in the diagnosis of portal hypertension, as well as in the evaluation of features specific to collateral routes of circulation. Intrasplenic radioportography in combination with other techniques should also be utilized for the recognition of the severity of liver affection in patients suffering from portal hypertension.

ON PATHOGENESIS OF HEMORRHAGE FROM ESOPHAGEAL AND GASTRIC  
VEINS IN PORTAL HYPERTENSION

By M. D. Patsiora, L. I. Aruin, L. M. Karpman and A. K. Yeramishantsev

The authors have investigated 123 patients with portal hypertension complicated by esophageal or gastric phlebectasis. In 88 patients there were gastrolesophageal hemorrhages in the anamnesis. In 34 patients during surgical procedures on esophageal and gastric veins the biopsy mucosa specimens from the cardiac portion of the stomach and lower esophagus were studied. It is concluded, that a hemodynamic factor — high portal pressure is of primary importance in causing hemorrhage from esophageal or gastric varices. The starting mechanism of bleeding is hypertensive crisis in the portal system. Acid-peptic factor could contribute to hemorrhage, while disturbances in the blood coagulation system could stipulate its massive character and duration, but they do not play a leading part in the occurrence of bleeding.

"Algorithmic Support of a Model of the Internal Sphere of an Organism"

Upr. i Inform. Protsessy v Zhivoy Pripode. [Control and Information Processes  
in Living Nature -- Collection of Works], Moscow, Nauka Press, 1971, pp 178-  
182, (Translated from Referativnyy Zhurnal, Kibernetika, No 3, 1972, Abstract  
No 3 V594 by V. Mikheyev).

Translation: Requirements are studied for a system of algorithmic support  
of the model of the "internal sphere" of an organism for realization by digi-  
tal computer. The most important are the following: 1) the model must have  
a modular structure with the minimum number of global variables; 2) all  
modules of the model should be described in the same language; 3) great inde-  
pendence (in the sense of programming) of individual modules from each other  
and from the system as a whole is possible; 4) good controllability of the  
program realizing the model; 5) the program should have wide possibilities  
for contact with the operator during the process of computation; 6) self-  
improvement of the model during operation. The modules of the general model  
of the "internal sphere" of the organism are the cardiovascular system, the  
temperature control system, the respiration control system, the system for

self-regulation of local blood circulation, the regulation of water and salt metabolism and the central nervous control system. Mathematical models are presented for the system of regulation of blood flow through the skeletal musculature and the system for temperature control in the organism. It is noted that programs have been created on their basis for machine realization in the input language BESM-ALGOL. A special "control" program is called for, allowing printout of all variables of interest to an investigator in digital or graphic form, as well as calculation of a number of arbitrary quantities for the model (mean values, integral estimates, etc.).

"Conditions for Acceleration in a Second-Order Linear Differential Game"  
Moscow, Prikladnaya Matematika i Mekhanika, No. 3, May/Jun 72, pp 420-425

Abstract: The following second-order system is considered

$$\frac{dx}{dt} = Ax + u - v, \quad (1.1)$$

where  $x$  is a two-dimensional phase vector,  $A$  is a constant  $2 \times 2$  matrix, and  $u$  and  $v$  are the controlling actions of the first and second players respectively. It is assumed that at any time  $t$

$$u(t) \in U, \quad v(t) \in V, \quad (1.2)$$

where  $U$  is a segment on a plane not reducing to a point and  $V$  is a convex, bounded closed set. A game is defined as the system (1.1) hitting at some previously assigned point  $m$ . Necessary and sufficient conditions are given for deviation in a second-order linear differential game. The notion of deviation is defined as follows: let the "realization  $u(\cdot)$ " be a measurable function of time  $u(t)$ ,  $t_0 \leq t < \infty$ , satisfying the restriction  
1/2

USSR

PATSKO, V. S., Prikladnaya Matematika i Mekhanika, No. 3, May/Jun 72,  
pp 420-425

(1.2) at any time  $t$  and formed by the first game in any manner in the process of the game. It is assumed that the second game for  $t \geq t_0$  can encounter any realization  $u(\cdot)$ . Its control of the second game must be constructed on the feedback principle using the discrete scheme  $\{v[x], \Delta[x]\}$ . The time discrete  $\Delta[x] > 0$  determines the magnitude of the semi-interval  $t^* \leq t < t^* + \Delta[x[t^*]]$ , over which the control  $v$  stays constant and depends on the position  $x[t^*]$ , where  $v[x]$  is selected in terms of  $v$ . Excluded from the discussion is the case in which the set  $V$  is a segment lying on a line passing through the segment  $U$ . Necessary and sufficient conditions for this case follow from the previous results of the theory of differential games.

"Electrolyzer for Making Metal Powder"

USSR Authors' Certificate No 267080, Cl. 40c, 1/02; 40c, 5/00, (C 22d), filed  
21 Feb 67, published 23 Jan 70 (from RZh-Metallurgiya, No 3, Mar 71, Abstract  
No 3G405P)

Translation: The electrolyzer contains a bath, anodes, disk cathodes fastened  
on a shaft, current supply unit, and drive mechanism. In order to decrease  
power consumption and increase dependability of electrolyzer operation, the  
drive mechanism is supplied with a toothed rack, which engages with the gear  
that is fixed on the shaft with the cathodes and imparts to the cathodes a  
reciprocating motion along the path of a pendulum. The contact at the point  
of the current supply to the shaft by the cathodes is made to be fixed. One  
illustration.

"Effect of Certain Derivatives of Carbamic Acid on the Cholinesterase Level in Blood Serum of Intact Rabbits

Dushanbe, Doklady Akademii Nauk Tadzhikskoy SSR, Vol 14, No 6, 1971, pp 68-69

**Abstract:** To determine whether a derivative of carbamic acid, preparation K<sub>2</sub>, affects the cholinesterase level in blood serum of intact rabbits, two derivatives of this series were investigated. The preparations were: 5-carbamyl oxy-2,5,6,6-tetramethyl-2-ethyl-delta<sup>3</sup>-dihydropyrane (K<sub>3</sub>) and 5-carbamyl oxy-2,2,5,6-tetramethyl-6-ethyl-delta<sup>3</sup>-dihydropyrane (K<sub>6</sub>). These compounds are white crystalline powders poorly soluble in water. Both preparations were given intraperitoneally in doses of 50-100-200 mg/kg in starch. The results were compared with proserine (10 mg/kg). During the first hours after the administration of 50, 100, and 200 mg of the K<sub>3</sub> and K<sub>6</sub> preparations, no marked changes were discovered in the activity of pseudocholinesterase. A sharp decline in this level was detected 5 hours after the administration of 100 mg/kg of the K<sub>3</sub> preparation, and on the third day after the administration

USSR

KHAYDAROV, K. Kh., et al., Doklady Akademii Nauk Tadzhikskoy SSR, Vol 14,  
No 6, 1971, pp 68-69

of 200 mg/kg of the K<sub>6</sub> preparation. Experiments with proserine were tested under similar conditions to compare its effect with the K<sub>3</sub> and K<sub>6</sub> preparations. Proserine was tested in a dose of 10 mg/kg. A reduction in the cholinesterase level of 30-34% was noted already in the first 5 hours. The maximum decrease was detected in the first day -- 53%, and a 45% reduction was observed by the third day. It was thus shown that the K<sub>3</sub> and K<sub>6</sub> preparations have some anti-cholinesterasic properties, but that the action is much weaker and less prolonged than that of proserine.

"Effect of Mumio on the Nucleic Acid Content of the Hematopoietic Organs During Acute Radiation Sickness Induced by Low-Intensity Irradiation"

Dushanbe, Doklady Akademii Nauk Tadzhikskoy SSR, Vol 13, No 7, 1970, pp 62-65

**Abstract:** Eighty mice received a single exposure to whole-body x-ray irradiation (450 r) and, 3 to 25 days later, were given a single peroral dose of the preparation mumyo (500 mg/kg). Irradiation sharply reduced the nucleic acid (particularly DNA) content of the bone-marrow and spleen cells. The decrease in RNA was less pronounced in the bone marrow than in the spleen. Restoration of the nucleic acids, especially of RNA, proceeded more rapidly in mice treated with mumyo than in the control group. Mumyo also stimulated hematopoiesis and cell division.

ABSTRACT. DETERMINATIONS OF THE DYNAMICS OF TOTAL PROTEIN AND PROTEIN FRACTIONS IN THE BLOOD SERUM OF RATS WERE MADE IN THE HIGH MOUNTAINS (3,500 M ABOVE SEA LEVEL) ON ANZOBSKIY PASS (TADZHIKSKAYA SSR) DURING A SCIENTIFIC EXPEDITION IN JULY TO AUGUST 1968, ORGANIZED BY THE TADZHIK MEDICAL INSTITUTE. THE EXPERIMENTS WERE CARRIED OUT WITH 90 COMMON RATS OF BOTH SEXES WEIGHING 150-170 G. THE RATS WERE DECAPITATED ON THE 1ST, 3D, 5TH, 7TH, 10TH, 12TH AND 15TH DAYS AFTER THEY HAD BEEN TRANSPORTED TO THE HIGH MOUNTAINS.

"Technology of Processing High-Silica Bauxites"

Moscow, Razvedka i Okhrana Nedr, No 1, Jan 73, pp 31-33

**Abstract:** The processing of high-silica bauxite ores is discussed with respect to increasing the extraction of alumina from these ores and productivity while reducing energy consumption. Sintering in a kiln was compared to sintering on OK-108 conveyors. Different alumina charges were tested under laboratory conditions at the Moscow Institute of Steels and Alloys (MISiS), where it was established that sintering in roasting conveyors is the best method since the productivity of gas-sintering pellets on the OK-108 conveyor was 600 kg sinter from 1 m<sup>2</sup> fire grate per hour instead of 30-40 kg from 1 m<sup>2</sup> inner surface of the kiln, and heat consumption of 800 thousand kcal per ton of sinter instead of 11-1400 thousand kcal in a kiln. Results of laboratory tests showed that alumina yield from the conveyor-roasted sinter was 90%, which was almost 5% higher than from kiln sintering. At the present time conveyor sintering is being mastered at VIMS, MISiS and VAMI (All-Union Aluminum-Magnesium Institute) on bauxites from different ore deposits. 5 bibliographic references.

"Characteristics of a Transistorized Quadriplate Gyrator"

V sb. Elektrotehnika (Electrical Engineering--collection of works), Kaunas,  
1970, pp 241-244 (from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12A196)

Translation: The authors analyze a gyrator circuit which consists of two voltage-controlled current generators. Parallel networks are introduced into the gyrator to ensure operation for any input voltage polarity. Special circuits based on multiple transistors are used to increase the input and output impedances. Two operating modes are possible: the compensation mode and the balanced mode. Analysis shows certain advantages of the balanced mode. Curves are given for the temperature dependence of the output current, and an expression is presented for the relative error as a function of the gyrator impedance. Five illustrations, bibliography of one title. N. S.

"The Rate of Covergence of the Distribution of the Maximum of Sequential Sums of Independent, Variously Distributed Random Vectors to the Limit Rule"

Lit. Mat. Sb. [Lithuanian Mathematics Journal], 1973, Vol 13, No 2, pp 139-147 (Translated from Referativnyy Zhurnal Kibernetika, No 10, 1973, Abstract No 10V32)

Translation: This work presents multidimensional analogues of several theorems of V. B. Nevezorov (RZHMAT, 1971, 12V49; 1972, 7V29) concerning the rate of convergence of a distribution of the maximum of sequential sums to the limit rule. The first three theorems give the rate of convergence as the distribution of the maximum approaches the normal rule, while the fourth theorem studies the case when identically distributed components belong to the areas of attraction of a k-dimensional symmetrical stable rule with index  $1 < \alpha \leq 2$ . Theorems 2 and 4 are new for the one-dimensional case as well.

"The Distribution of the Maximum of Sequential Sums of Independent, Identically Distributed Random Vectors"

Lit. Mat. Sb. [Lithuanian Mathematics Journal], 1973, Vol 13, No 2, pp 133-138 (Translated from Referativnyy Zhurnal Kibernetika, No 10, 1973, Abstract No 10V31)

Translation: This article presents several limit theorems with an estimate of the residual terms for the distribution of the maximum of sequential sums of independent, identically distributed random vectors (RV), produced by direct probability methods from the works of V. A. Rogozin (RZHMAT, 1967, 3V19) and V. B. Nevzorov (RZHMAT, 1971, 12V49). Suppose  $\xi_i = (\xi_{i1}, \dots, \xi_{ik})$ ,  $i = 1, 2, \dots, n$  are independent, identically distributed RV

$$S_0 = 0, \quad S_i = \sum_{j=1}^i \xi_j, \quad \bar{S}_n = (\max_{0 \leq j \leq n} S_{ji}, \dots, \max_{0 \leq j \leq n} S_{kj}),$$

$$\sigma = M\xi_1 = (a_1, \dots, a_k), \quad \sigma_j^2 = M(\xi_{1j} - a_j)^2,$$

$\Lambda$  is the correlation matrix of RV  $\xi_1$ . Suppose  $\bar{F}_n(x)$ ,  $x \in \mathbb{R}_k$ , represents the distribution function of the RV

1/2

USSR

PAULAUSKAS, V. I., Lit. Mat. Sb., 1973, Vol 13, No 2, pp 133-138

$$\left( \frac{\bar{S}_{n1} - a_{1n}}{a_1 \sqrt{n}}, \dots, \frac{\bar{S}_{nk} - a_{kn}}{a_k \sqrt{n}} \right),$$

while  $\Phi_\Lambda(x)$  is the normal distribution function with zero vector of mathematical expectations and matrix of second moment  $\Lambda$ . The most important theorem in the article is

Theorem 1. If  $a_i > 0$ ,  $\beta_{3i} = M|\xi_{1i} - a_i|^{3\infty}, i = 1, 2, \dots, k$  and  $\Lambda$  is a nondegenerate matrix, then

$$\sup_{x \in R^k} |\bar{F}_n(x) - \Phi_\Lambda(x)| = O\left(\frac{1}{\sqrt{n}}\right),$$

where the constant in the estimate depends on the dimensionality and parameters of the RV.

"Concentration Function of Finite-Dimensional and Infinite-Dimensional  
Random Vectors"

Lit. mat. sb. [Lithuanian Mathematics Collection], 1973, 13, No 1, pp  
137-157 (Translated from Referativnyy Zhurnal - Kibernetika, No 8, 1973,  
Abstract No 8V15 by the author)

Translation: This work consists of two parts. The first part contains a study of the concentration functions for random elements with values in a separable real Hilbert space. A simple method is used to reduce estimation of the concentration function in an infinite dimensional space to estimation of the concentration function of certain one-dimensional random quantities. The use of known estimates in the homogeneous case allows a number of estimates to be produced for concentration functions in the infinite-dimensional case. The second portion of the work studies the concentration functions of K-dimensional random vectors. The primary results are an amplification and summarization of the results of Esscyen.

1/1

USSR

PAULAUSKAS, V. I.

"Estimate of Rate of Convergence in Central Limit Theorem for Variously  
Distributed Components"

Lit. Mat. Sb. [Lithuanian Mathematics Collection], 1972, Vol 13, No 4, pp  
183-194 (Translated from Referativnyy Zhurnal Kibernetika, No 4, 1972,  
Abstract No 4V44, by the author).

Translation: A proof is presented for a one-dimensional estimate in a central  
limit theorem for differently distributed independent random quantities by  
means of pseudomoments as announced in (RZhMat, 1971, 11V43), as well as a  
multidimensional analogue of the estimate. It is shown that all estimates  
with pseudomoments produced in earlier works of the author can be strengthened  
by replacing the pseudomoments with so-called difference moments.

Translation: Let  $X_1, \dots, X_n$  be independent random quantities with general distribution function  $F(x)$ ,  $EX_1=0$ ,  $EX_1^2=1$ . Let  $F_n(x)=P\left(\frac{1}{\sqrt{n}}\sum_{j=1}^n X_j < x\right)$ ,  $\Phi(x)$

be a normal (0,1) distribution function  $\mu_k = \int_{-\infty}^{\infty} x^k d(F - \Phi)$ ,  $\nu_k = \int_{-\infty}^{\infty} |x|^k d(F - \Phi)$ .  
 If  $\mu_1 = \dots = \mu_{m-1} = 0$  and  $\nu_m < \infty$  for some integer  $m \geq 3$ , then

$$\sup_x |F_n(x) - \Phi(x)| < \frac{C(m)}{\sqrt{n}} \max\left(\frac{1}{\nu_{m+1}}, \nu_m\right)$$

for any  $n$ , where the constant  $C(m)$  depends only on  $m$ . In particular,  
 $C(3) \leq 2, 16$ . V. Petrov.

"Effect During the Process of Irradiation of Ionizing Radiation on  
Polymers With Conjugated Bonds"

Moscow, Doklady Akademii Nauk SSSR, Vol 192, No 4, 1970, pp 835-837

**Abstract:** The effects of gamma-rays from  $^{60}\text{Co}$  at a dosage rate of 1.2-1.3 Mrad/hr on the electrophysical properties of the organic semiconductors polyacetonitrile (I), paracyanogen (II), polyphenylcyanamide (III), polydiacetyl (IV), polybutylcyanamide (V), and polybutylcyanate (VI), specifically on their electrical resistance, were studied during the process of irradiation. For I, II, IV, and VI with a low ohmic resistance that were prepared at 450-500°, irradiation at doses  $\leq 5 \times 10^9$  rad did not result in any changes of resistance. Irradiation of V, which also had a low ohmic resistance, produced a slow rise in resistance in the dose range of 0-110

Mrad and an abrupt rise at 110-140 Mrad. In the case of VI with a high ohmic resistance, which was prepared at 350°, ionizing radiation in the dose range from 0 to 170-200 Mrad produced further polymerization and cross-linking, which were reflected in a decrease of the resistance, while doses > 200 Mrad decomposed the polymer. The results showed that irradiation at doses up to  $5 \times 10^9$  rad of I, II, IV, and VI with a low ohmic resistance did not change the physico-chemical and electrophysical properties of these polymers - i.e., they are suitable for use in radioelectronic devices operating under conditions of exposure to ionizing radiation.

"Synthesis of Thermally Stable Oxidation-Reduction Polymers"

Abstract: In light of the increasing interest in redox polymers, a synthetic route was developed based on heterocondensation of disodium acetylenide (DNaAc) with 2,5-dibromoquinone (DBQ) and 1,4-dimethoxy-2,5-dibromobenzene followed by demethoxylation with HI. It was determined that the redox capacity of the polymer drops with increased rehydration. The polymer obtained maintained its redox capacity for 10 hrs even when heated in air to 300°C. This polymer shows semi-conductive properties. The synthesis took place in two stages: first stage was carried out in a flask in hexadecane medium, with reaction temperature of 250°. The process lasted 10 hrs in argon atmosphere. The ratio of DNaAc to DBQ was 2:1. Second stage was carried out in solid phase in temperature range 300-450° yielding the polymer, a black powder insoluble in water or organic solvents.

Translation: This substance has low toxicity and when injected into white rats and mice (1/5-1/10 LD<sub>50</sub>) it produces only a tendency for total blood protein, including the albumin fractions, to decrease with a slight increase in the amount of globulin fractions. Some changes occur in the higher divisions of the animals' central nervous system.
