"Main Line Theorems for Semi-Markov Decision Processes"

Tr. Mat. In-ta. AN SSSR [Works of Mathematics Institute, Academy of Sciences USSR], Vol 111, 1970, pp 208-223, (Translated from Referativnyy Zhurnal, Kibernetika, No 6, 1971, Abstract No 6 V539 by A. Mikhaylova).

Translation: The term "main line theorem" arose in connection with analysis of models of development of economic systems. The optimal trajectory of a multi-step process is compared with a long path, which can be divided into an approach to a high speed line, movement along the line and the final path from this line to the assigned ending point. Stable states of a semi-Markov process and its characteristics are studied. A problem in linear programming is presented, the solution of which produces an optimal stable state of the process being studied. The variable dual problems allow the "quality" of the states of the process to be evaluated. The asymptotic behavior of approach functions for Markov and semi-Markov decision processes is studied. A main line theorem is formulated.

"Sets With 'Self-Control'"

Moscow, Doklady Akademii Nauk SSSR, vol. 199, No. 4, 1971, pp 766-769

Abstract: In this investigation of the "self-control" of sets in the problem of successive evaluation of shift parameters in arbitrary loss functions, the parameter $\theta \in \mathbb{R}^1$ in a standard system of direct measurements $x_i = \theta + \varepsilon_i$, $i = 1, 2, \dots$, is considered, where the measurement errors ε_i are assumed to be random quantities with fully known distribution functions $F(x)$. The purpose of this article is thus to study successive estimation of the shift parameter θ in specified independent observations x_1, x_2, \dots , distributed in accordance with the law $F(x - \theta)$. A formula is derived for the optimal invariant evaluate $\hat{\theta}$ of the parameter θ , and a theorem involving the errors ε_i subjected to hypernormal distribution and the derived formula is stated and proved. The authors are connected with the Leningrad Division of the V. A. Steklov Mathematical Institute.

"On the Theory of Sequential Valuations"

Moscow, Doklady Akademii Nauk SSSR (Proceedings of the Academy of Sciences USSR), Vol 194, No 2, 1970, pp 270-272

Abstract: This is related to a previous paper and relies on the work of I. A. Ibragimov and R. Z. Khas'min. The authors stress the asymptotic and point aspects of sequential valuations in probability theory, using a non-Bayesian approach. Ibragimov and Khas'min set the condition that informational quantities are continuous for $n \leq 20$ (the I-K condition) and show the asymptotic behavior of the dispersion of the Pitman evaluation $\hat{\theta}_n$ for parameter θ . The authors seek an optimum strategy for the sequential evaluation of $S = (\zeta, T_\zeta)$ as a pair consisting of a Markov moment ζ and statistics T_ζ , evaluating the given function $g(\theta)$.

An asymptotically optimal plan S is sought that minimizes $E_\theta (T_\zeta - g(\theta))^2$ under the condition $E_\theta \zeta \leq n$, where n is a given positive number. Theorems 1/2

"Prospects of the Application of the Melting Cyclone for the Production of Melted Refractories"

Moscow, Ogneupory, No 5, 1973, pp 50-54

Abstract: The process of cyclone melting was investigated with a view to produce melted refractories of the magnesium-spinel and brazilite-corundum types. Experiments were carried out at the Institute of the Problems of Material Science of the Academy of Sciences UkrSSR. The experiments indicated the possibility of applying melting cyclones with the use of a blast enriched with oxygen for the production of cast fused refractories with a 1800-1900°C fusion temperature in which the melt aggregates in the warming forehearth for aftercasting into molds. The dust removal in cyclone melting does not exceed 5%, thus ensuring the production of a melt which is close to the initial charge in chemical composition. The optimum content of oxygen in the blast at an approximate natural gas consumption of 1.5 nm³/kg charge was determined.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. CLINICAL X RAY STUDIES WERE MADE OF 80 PATIENTS WITH EPICONDYLITIS AGED 26 TO 53 YR WITH DIFFERENT PHASES OF THE DISEASE. THESE STUDIES INDICATED THAT THE PATHOLOGICAL PROCESS IN EPICONDYLITIS OF THE HUMERUS IN THE INITIAL PHASE IS PRIMARILY LOCALIZED AT THE SITE OF TRANSITION OF TENDON INTO THE BONE TISSUE OF THE EPICONDYLE. LATER, AS THE DISEASE DEVELOPS, SPREAD AND PENETRATION OF THE DEGENERATIVE DYSTROPHIC ALTERATIONS OCCURS WITH THE PRESENCE OF ASEPTIC INFLAMMATION IN THE MUSCLE TENDONS ATTACHED TO THE EPICONDYLE, IN THE PERIOSTEUM, BONY TISSUE, LIGAMENTS CONNECTED TO THE CAPSULE OF THE ELBOW JOINT, AND IN THE NERVES WHICH INNERVATE THE COMPONENTS OF THE ELBOW JOINT. WITH THE CLINICAL PROGRESSION OF THE DISEASE, DAMAGE TO NERVE FIBERS CAUSES THE CHARACTERISTIC PAIN SYNDROME DETECTED UPON EXAMINATION OF THE PATIENT. THE EPICONDYLE OF THE HUMERUS IS ONLY THE POINT AT WHICH THE PAIN IS LOCALIZED BY PROJECTION. THE CHANGES OCCURRING IN IT ARE A SECONDARY MANIFESTATION OF THE DISEASE. THEREFORE, THE TERM EPICONDYLITIS OF THE HUMERUS DOES NOT REFLECT THE ESSENCE OF THE DISEASE IN ALL ITS VARIEGATED CLINICAL MANIFESTATIONS. IT WOULD BE MORE CORRECT TO CALL IT PERIARTHRITIS OF THE ARTICULATIO CUTIBI.

"Experimental Investigation of the Heat Exchange of Ferromagnetic Solids Heated in the Electromagnetic Field"

Kishinev, Elektronnaya Obrabotka Materialov, No. 3 (39), 1971,
pp. 50-54

Abstract : The heat exchange process of ferromagnetic solids heated in the electromagnetic field was experimentally investigated according to a shown block diagram on a steel plate and a steel plate in contact with a capillary-porous ceramic plate. The carried out experiments are described and the results are analytically discussed by reference to the heating-time curves. It was found that the profile of the heat flux and its density on the surface of the steel plate heated by electromagnetic induction and heated conductively from the electroheating element differ considerably. The observed effects and regularities can

be explained somehow on the basis of the theory of elastic, heat, and electric phenomena in ferromagnetic solids. Their physical source may be found in the effect of d-electrons on the behavior of s-electrons which determine the electronic part of ferromagnetic heat transfer. At low temperatures, it can be anticipated that the heat resistance is dependent on the scattering not only of s-electrons on phonons, but also on elementary excitations of the system of internal d-electrons. "An Integrated Circuit Digital Voltmeter"

Novosibirsk, Avtometriya, No 2, March-April 1970, pp 96-99

Abstract: The first part of this article is a brief discussion of the history of stepwise equalizing digital voltmeters, in which the following Soviet second generation instruments (discrete solid state components) are mentioned and their accuracies indicated: Sh Ch 1412 - 0.05%, Sh Ch 1512 and Sh Ch 1513 ~ 0.01%.

The new instrument is the Sh Ch 1312, designed at the Vibrator factory and intended for serial production. The microtransistors are types GT108T, MZD and M5, providing an initial accuracy of 0.1% and the capability of development to 0.01%. Standard IP-1 switch microcircuits were found unsuitable, since the production models tested showed accuracies in order of magnitude worse than those obtainable with the transistors listed. To simplify the logical part of the circuit, a unipolar switch control circuit was used with GT108T and MZD transistors as switches. Polarity reversal is accomplished by including a 1/2

USSR

ROMANOVSKIY, V. R., Novosibirsk, Avtometriya, No 2, March-April 1970, pp 96-99
supplementary base source, simplifying the measuring switch control circuit
but complicating the decoder. The control circuit is made of integrated solid
state germanium microcircuits, which have low cost and are available in
quantity. The stages include a shift register, code register, and inverse
code decoder, memory circuit and decoder.

The major difficulties were encountered in setting up comparison circuits,
due to the severe demand on the zero unit. In particular, the available type
P2222 balance stages have far too low a resistance for this purpose. This
problem was solved by using field transistors and subsequent amplification of
the signal difference with the P2222 circuit. The resulting zero unit has a
sensitivity on the order of 100 microvolts and a response time of not more
than 100 microseconds from -300 microvolts to +1 volt. The input current is
less than $10^{-9} - 10^{-10}$ amperes. It is packaged separately and shielded with
dimensions of 93 x 67 x 15 millimeters.

The instrument is made without a housing, with dimensions not over
200 x 120 x 235 millimeters and a weight not greater than 5 kilograms.

"Polarization of Protons as a Function of Energy during Elastic Scattering in
 ^{24}Mg "

Moscow, Izvestiya Akademii Nauk SSSR -- Seriya Fizicheskaya, Vol XXXV, No 8,
1971, pp 1695-1696

Abstract: The authors used the double-scattering method to measure the extent to which polarization of protons during elastic scattering in ^{24}Mg depends on energy. Their experiments were carried out for energies ranging from 5.9 to 6.5 million electron volts for 60° and 120° angles of scattering. While measuring the dependence of polarization on energy during elastic scattering, they also evaluated it for the case of inelastic scattering of protons in ^{24}Mg with an excitation level of 1.37 million electron volts, borrowing some needed data from another work. They found that polarization of protons varied considerably as a function of their energy for both angles in both types of scattering. The authors emphasize that their results are merely preliminary. They are planning further experiments to obtain spectroscopic information and data on the mechanism by which polarization is initiated.

"What is Mathematical Biophysics. (Kinetic Models in Biophysics)"

Chto takoye matematicheskaya biofizika. (Kineticheskiye modeli v biofizike)
(cf. English above), Moscow, "Prosveshcheniye", 1971, 136 pp, ill. 23 k.
(from RZh-Kibernetika, No 11, Nov 71, Abstract No 11V864 K)

Translation: The book popularizes problems of mathematical modeling of biological processes. Principal attention is devoted to modeling of periodic processes in various biological systems -- This is the so-called "biological clock" problem. Some examples of oscillatory systems are considered: oscillations in the dimensions of colonies of cells and cellular nuclei, the intensity of photosynthesis and population of two coexisting species. The method of the modern theory of oscillations is used as the method of study for these examples. The first chapter is devoted to presentation of kinetic governing principles in biology. The second chapter outlines modern mathematical methods of studying dynamic systems: the phase pattern method

1/2

and the method of slowly changing amplitudes. The third chapter is devoted to construction and study of a model of growth of a colony of microorganisms and use of the results of modeling in biological industry. The fourth and final chapter deals with a complex of problems related to periodic processes in various kinetic systems. It is noted that this book will be of use to teachers of physics, biology, chemistry and mathematics, and also in biology circles for pupils. V. Mikheyev.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. MUTUAL SYNCHRONIZATION IN A CHAIN OF COUPLED TOMSON'S TYPE OSCILLATORS IS STUDIED IN THE CASES OF SOFT AND HARD EXCITATION. THE METHOD OF STEP BY STEP ABRIDGEMENT PROPOSED BY R. V. CHICHLOV WAS APPLIED. ANALOGOUS AND DIGITAL COMPUTERS WERE USED. IT IS PERMITTED TO MODEL DISTRIBUTED AUTO OSCILLATORY CHEMICAL RESPONSES, TAKING PLACE IN ONE DIMENSIONAL REACTOR. IN THE CASE OF SOFT EXCITATION THE SINGLE STABLE MODE OF OSCILLATIONS EXISTS WHEN ALL OSCILLATORS ARE TUNED TO THE SAME FREQUENCY AND PHASE. IN THE CASE OF HARD EXCITATION, BESIDE THE ABOVE MENTIONED MODE OF OSCILLATIONS, INDEPENDENT SYNCHRONOUS AUTO OSCILLATIONS OF SOME GROUPS OF OSCILLATORS SEPARATED FROM EACH OTHER BY GROUPS OF UNEXCITED AUTO OSCILLATORS ARE POSSIBLE. IF, IN A CHAIN WITH FIXED COEFFICIENT OF COUPLING, AN OSCILLATOR IS DETUNED WITH RESPECT TO ALL OTHERS, THE BAND OF SYNCHRONIZING SUBSTANTIALLY DEPENDS ON ITS POSITION IN THE CHAIN. IT IS WORTH TO NOTE THAT THE BAND OF SYNCHRONIZING IN A RING OF N OSCILLATORS TWICE AS LARGE AS THAT OF A LINE OF N OSCILLATORS. WHEN CHAIN CONTAINS TWO NEIGHBOURING GROUPS OF OSCILLATORS WITH EQUAL PARTIAL FREQUENCIES INSIDE EACH GROUP, THE BAND OF SYNCHRONIZING IS THE LESS, THE CLOSER THE RATIO OF NUMBERS OF OSCILLATORS IN EACH GROUP TO UNIT.

"Characterizations of Sets and Their Application to the Theory
of Graphs"

Pr. nauk. Inst. matem. i fiz. teor. PWr. (Scientific Works.
Institute of Theoretical Mathematics and Physics), 1972, 6,
pp 3-11 (from RZh-Kibernetika, No 5, May 73, abstract No 5V503
by the author)

Translation: Let X and T be two arbitrary sets. We shall understand partial characterization of set X and T to mean a function of one variable $f:D_f \rightarrow T$, where $D_f \subseteq X$ is its region of definition. We shall call a partial characterization complete if its region of definition is the entire set X . In addition we shall say that a partial characterization f reaches the set $S \subseteq T$ if $S \subseteq f(D_f)$. Let F be a set of partial characterizations of set X . We shall say that the partial characterization g is generated by F if for each finite subset $Y \subseteq D_g$ there exists a partial characterization $f \in F$ whose region

1/2

"Polarographic Investigation of Stabilized Imino Acid Radicals"

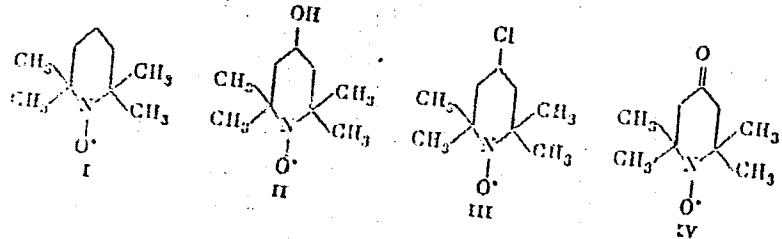

Leningrad, Zhurnal Obshchey Khimii, Vol. 42(104), Vyp 4, 1972, pp 743-746

Abstract: The stabilized imino acid (I-IV) were investigated polarographically using a mercury calomel electrode. New data were accumulated on the change in response of the imido acid to solvents -- 20% and 90% methanol, benzene-methanol, and dimethylformamide (DMF) -- and other environmental conditions, and of substitution (-OH, -Cl, and = O) in the ring. The value of $-E_{1/2}$ increased in the above order of solvents -- from about 0.25 for 20% ethanol to 1.25 for DMF. The value of $-E_{1/2}$ decreased in the order I, II, III, IV. The reduction of the imino acid radical proceeds with the transfer of one electron.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. C PRIME14 AMINO ACIDS INCORPORATION IN VITRO INTO TOTAL NUCLEAR PROTEINS AND DNP OF LIVER, SPLEEN AND THYMUS OF RATS IRRADIATED AT A DOSE 1000 R HAS BEEN STUDIED. PROTEIN SYNTHETIZING SYSTEM OF DNP WAS THE NUCLEAR RESIDUE WHICH DID NOT CONTAIN GLOBULINS. 1 AND 24 HOURS AFTER THE IRRADIATION THE PRONOUNCED INHIBITION OF C PRIME14 AMINO ACIDS INCORPORATION INTO NUCLEI AND DNP OF THYMUS CELLS WAS NOTED. 24 H AFTER THE IRRADIATION 1 H AFTER THE IRRADIATION TOOK PLACE IN THE SPLEEN. ON THE OTHER HAND 1 H AFTER THE IRRADIATION EITHER THE STIMULATION OR THE INHIBITION DEPENDING UPON THE SEASON WAS SHOWN. IN THE LIVER AT ALL TIME INTERVALS STUDIED SOME ACTIVATION IN LABEL INCORPORATION HAS BEEN OBSERVED.

"Radiation Biochemistry and Medicine"

Moscow, Meditsinskaya Gazeta, 28 Apr 72, p 3

Abstract: The role of biochemical processes in the effects of radiation on cells is discussed. Particular emphasis is placed on current knowledge about radiation damage to DNA molecules in conjunction with restorative enzyme systems and the possibility that radiotoxins form as a secondary effect of radiation. It is noted that ionizing radiation causes changes in the genetic apparatus of the cells and contributes to spontaneous and natural mutation responsible for the evolutionary process. One of the primary tasks for radiation biochemistry is deciphering the change in the substrate of the hereditary apparatus. The stimulating effect of radiation on enzyme activity is explained. The biochemical mechanisms of remote effects of ionizing radiation, which are divided into intumescence and nonintumescence forms are discussed. It is believed that these are caused by a change in or loss of the nitrogen bases of DNA, which causes a change in the pyrimidine bases. It is mentioned that various effects can be produced by using different doses of radiation.

"Radioprotectors and Radiosensitizers"

Moscow, Meditsinskaya Gazeta, 26 Jun 70, p 3

Translation: Protecting the organism from the effect of ionizing radiation by the use of various chemical compounds is one of the most promising areas of modern radiobiology. The danger of the whole organism being affected by large doses of radiation arises rarely. Local irradiation by x-rays or gamma-rays of parts of the body, including also healthy tissues, in the course of x-ray therapy of malignant neoplasms, is much more frequent.

Is it possible to lessen the injurious effect of ionizing radiation by administering certain chemical compounds to the organism prior to irradiation?

It was discovered about 30 years ago that thiourea, for example, is capable of preventing to a significant extent inactivation of certain enzymes due to the effect of x-rays. Later it was established that the amino acid cysteine, if administered intraperitoneally prior to irradiation, is capable of preventing death of animals, while all control rats died. Aminothiol, a derivative of

1/5

USSR

R

ROMANTSEV, Ye., Meditsinskaya Gazeta, 26 Jun 70, p 3

cysteine, has an even more marked radioprotective effect.

From that time on, there has been an intensive search for new radio-protectors. By 1965, more than 3,000 chemical compounds had been tested for possible radioprotective action. Acute shortage of oxygen in the air before irradiation also ensured radiochemical protection.

All radioprotectors can be conditionally divided into two large groups: the ones administered once, which have a radioprotective effect if given once 20-30 minutes before irradiation (aminothiols, certain amino acids, cyanogenetic substances, and so on) and the so-called continuous-action types (certain vitamins and hormones), which require multiple administrations prior to irradiation, and under the condition that sublethal doses of ionizing radiation are used. A combination of various preparations offers the best protection.

The search for more effective radioprotectors is complicated by the fact that many of them are effective only in subtoxic doses. However, several

2/5

R

USSR

ROMANTSEV, Meditsinskaya Gazeta, 26 Jun 70, p 3

methods exist that make it possible to reduce the toxicity of these substances. In many radiobiological centers the search goes on for radioprotectors with a low toxicity and a prolonged effect.

What is the mechanism of chemical protection from the effects of ionizing radiation in the mammalian organism?

The most widespread notion is that of the biochemical mechanism of action of radioprotectors. Up to the moment of optimum radioprotective action after administration, the radiosensitivity of several biochemical processes keeps increasing. The aminothiols affect these processes by forming temporary mixed disulfide bonds between them and the specific enzyme systems. The enzymatic activity of certain processes is slowed down, and the active SH-groups of the enzymes are temporarily blocked and thereby protected from the effect of oxidizing radicals and radiotoxins formed in the course of irradiation. In 1.5-2 hours, the enzymatic activity of the blocked enzymes is completely reestablished.

In this manner, the radiosensitivity of the cell can be changed in the direction of radioresistance. From this it follows that with the help of chemical
3/5

USSR

R

ROMANTSEV, Ye., Meditsinskaya Gazeta, 26 Jun 70, p 3

compounds, the cells can also be made more sensitive to radiation. A positive solution of this problem can have quite a important practical significance. If compounds could be found that would increase the sensitivity of cancer cells to ionizing radiation, this would make the fight against malignant neoplasms a great deal easier.

In recent years radiosensitizers have been discovered, compounds whose administration to animals prior to irradiation increases sensitivity to radiation. Radiosensitizers can be of interest not only to oncologists, but also to specialists studying the problems of radiation sterilization of medical equipment, products, and so on. If it were possible to find radiosensitizers suitable for this task, then the high doses of radiation could be lowered.

Iodoacetamide can serve as an example of a radiosensitizer of micro-organisms. It was found that during irradiation this chemical compound forms radicals which have an additional damaging effect. A radiosensitizer like Vikasol can penetrate the cell, oxidize under the effect of radiation, and form a radiotoxin which intensifies the effect of the ionizing radiation.

4/5

* 23 *

USSR

R

ROMANTSEV, Meditsinskaya Gazeta, 25 Jun 70, p 3

The mechanism of the action of radiosensitizers can be connected both with more damage to the living cells during irradiation, and with the weakening of regenerative processes after irradiation. Radiosensitivity was achieved also by changing the fine structure of DNA and increasing oxygen pressure in the cells under increased pressure. In the latter case, the oxidizing radical output increased, while the dose of irradiation remained the same, and the cells were damaged more.

At present, dozens of radiosensitizers are known. As is frequently the case, among 1,000 new substances tested, only a few become part of the pharmacopeia. Among radioprotectors, such preparations are, for example, mercamine hydrochloride and ascorbate. A special approach, based on the principles of radiosensitization, is irradiation of tumors under increased oxygen pressure.

There is every reason to hope that in the near future highly effective radioprotectors and radiosensitizers can be found.

Nr 1, pp 69-72ON THE CHEMICAL STATE AND CONTENT OF RADIOPROTECTOR IN SOME
TISSUES OF RAT AT EARLY TIME-INTERVALS AFTER CYSTAMINE
ADMINISTRATIONKoshcheyenko, N. N.; Filippovich, I. V.; Romantsev, Ye. F.
Institute of Biophysics USSR Ministry of Health, Moscow

The relative content of MEA, cystamine and mixed disulphides of protector with cellular proteins in rat thymus, spleen and liver during 3 hr after i. p. cystamine administration at a radioprotective dose has been studied. It was established that at all time-intervals studied only mercapto-form of the protector has been found in tissues. Cystamine and mixed disulphides content was less than 0.01 μmole per 25--100 mg of tissue. The coincidence of maximal radioprotective effect and MEA accumulation in the tissues studied after cystamine administration was noted. One and the same biochemical mechanism (or mechanisms) of radioprotective action for MEA and cystamine may be postulated on the base of similarity between time-course of MEA accumulation in various tissues after MEA and cystamine administration. The difference between these results and those from paper of Betz (Betz E. H., Mewissen D. J., Lelievre P., Intern. J. Rad. Biol., 1962, 4, 231) probably may be explained by the fact that in the paper of Betz the tissues were not washed before homogenization.

Republic Interdepartmental Scientific-Technical Collection], No 13, 1970, pp 88-94 (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 10, 1970, Abstract No 10B273, by T. D.)

Translation: A dc voltage-to-binary 10-digit code converter is described. The converter is built of semiconductor devices and operates by digit-by-digit comparison. The principal error of the converter is not over $\pm 0.25\%$, the input impedance is 2 kohm, the speed is 2000 conversions per second, the voltage measurement range is 0-10 v. The converter uses "Mir-1" potential modules. The principal non-standard units of the converter determining its accuracy are made of high-stability elements. The compensator uses a wire-wound resister of manganin microwire, silicon transistors, and silicon diodes. A potential type null-balance device with a sensitivity of ± 3 mv is used.

Moscow, Otkrytive, izobreteniya, pramyshlennyye obraztsy, tovarnyye znaki, 1970, No 25, Soviet Patent No 278239, class 42, filed 12 May 69, published 5 Aug 70, p 137

Translation: This Author's Certificate introduces an analog with automatic data input for solving systems of differential equations. The device contains interconnected integrating capacitors, digital controlled resistors, an amplifier for generating null-potential points, controlled switches, and a digital automaton. As a distinguishing feature of the patent, the required number of digital controlled resistors is reduced by including prediction devices in the analog which are connected through the switches to the outputs of the amplifier for generating null-potential points. The outputs of the prediction devices are connected to the resistors controlled from the digital automaton and to the integrating capacitors, which are connected through two-position switches to the amplifier input and to a zero-potential line.

"Chemical State and Content of the Radioprotector in Some Rat Tissues
in Early Periods After Intraperitoneal Administration of Cystamine"
Moscow, Voprosy Meditsinskoy Khimii, Vol 16, No 1, Jan/Feb 70, pp
69-72

Abstract: Spectrophotometric determinations of tissue homogenates indicated that cystamine, after intraperitoneal administration to rats in a dose of 75 mg/kg, accumulated in the thymus, spleen, and liver in the form of beta-mercaptoproethylamine, while unchanged cystamine and mixed disulfides of the radioprotector with proteins were absent. The maximum content of beta-mercaptoproethylamine in tissues was observed 15-30 min after administration of cystamine, i.e., during the period of the maximum radioprotective effect. E. H. Setz et al (Int. J. Radiat. Biol. 4, 231, 1962) used a polarographic method of determination, and found a maximum content of radioprotector in tissues 2 min. after administration of cystamine, but their results were presumably due to the fact that the organs removed from the abdominal cavity were not washed before homogenization.

"Titanium as a Corrosion Resistant Material for Equipment for the Production of α - and β -Dichlorohydrins of Glycerine"

Moscow, Zashchita Metallov, Vol 10, No 1, Jan-Feb 74, pp 39-40

Abstract: Corrosion tests in the technological media used in the production of α - and β -dichlorohydrins of glycerine showed that titanium is the best structural material for this equipment. Corrosion rates were calculated on the basis of weight loss. Specimens of titanium equipment utilized for 3-3.5 years showed practically no corrosive damage. Specimens of titanium-aluminum-zirconium alloy containing 2-3% aluminum and not over 3% zirconium also showed very little damage after 2.5-3 years of testing.

105566d Temperature dependence of the position of the self-absorption edge of Seignette salt and triglycine sulfate crystals. Viblyi, I. F.; Romanyuk, N. A. (USSR). *Opt. Spektrosk.* 1970, 28(2), 307-10 (Russ.). The position of the self-absorption edge of samples X, Y, and Z cuts of Seignette salt and triglycine sulfate crystals in a natural and polarized light with variations in temp. over Curie points area is investigated. The curve $\lambda_c T$ was presented in 3 linear portions. The obsd. portion of the $\lambda_c T$ curve relates to temp. region 20-4° and -20-15°, for Seignette salt, and 35-55° for the glycine sulfate in the phase transition. The slope is smaller than that of two other portions for the former, and smaller or larger than the edge for the latter. The mentioned differences in temp. effect relate to the sharp change of a spontaneous polarization, and the distinctive features of a spontaneous deformation of the domains of these crystals. "A Wobbulator for Vacuum Resonators in Discriminators"

USSR Author's Certificate No 256093, filed 10 Apr 67, published 3 Apr 70
(from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11D1G0 P)

Translation: This Author's Certificate introduces a wobbulator for vacuum resonators in discriminators. The device contains a rotating plate located in the face end of the resonator. To improve reliability and simplify operation, the rotating plate is separated from the vacuum resonator by a hermetically sealed cap, and is equipped with rotators which operate mechanically, are transparent to radio waves, and are connected to the resonator. Resumé.

"Investigation Of Reflex Klystrons In Regimes Of Rectification And Bias"

Elektron. tekhnika. Nauchno-tekhnik. sb. Elektron SVCh (Electronic Technology).

Scientific-Technical Collection. Microwave Electronics), 1970, No 9, pp 86-90

(from RZh-Elektronika i yeye primeneniye, No 12, December 1970, Abstract No 12A165)

Translation: Reflex klystrons for the 3-cm, 8-mm, and 4-mm band were investigated in regimes of rectification and signal bias. Their sensitivity in a rectification regime is not lower, and in a number of cases is higher, than the sensitivity of crystal rectifiers for corresponding wave bands. Author's Abstract.

"A Device for Absolute Measurements of the Acceleration Due to Gravity"

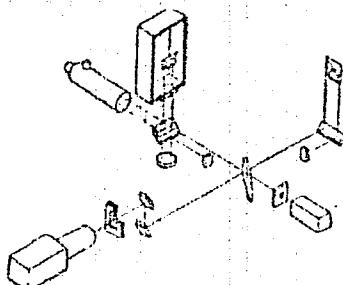

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki,
No 7, Mar 72, Author's Certificate No 329496, Division G, filed 28 Jul 70,
published 9 Sep 72, p 184

Translation: This Author's Certificate introduces a device for absolute measurements of the acceleration due to gravity. The device contains a movable reflector, a light source, a semitransparent mirror, a horizontal mirror such as a mercury mirror, and systems for measuring path length and time. As a distinguishing feature of the patent, measurement accuracy is improved by adding an autocollimator and a mirror placed between the semi-transparent mirror and the movable reflector.

"Using Gunn Oscillators as the Active Elements of an Antenna Array"

Tr. Mosk. aviat. in-ta (Works of the Moscow Aviation Institute), 1970,
vyp. 203, pp 81-93 (from RZh-Radiotekhnika, No 1, Jan 71, Abstract No 1344)

Translation: The author notes the advantages of Gunn diodes over transistor-varactor networks and avalanche diodes for use in active antenna arrays. Various modes of Gunn diode operation are considered; mention is made of the advantage of resonance modes: the mode with delay of domain formation and the mode with suppression of domains. It is shown how the elements of the array may be constructed by connecting the Gunn diodes in a symmetric or asymmetric dipole and also in a slot. The parameters of such elements are analyzed; a method of engineering calculation is proposed. The results of an experimental study are presented which show the convenience of controlling the parameters of the array. Thirteen illustrations, bibliography of nine titles. N. S.

"The Action of the Bacterial Preparations Entomobacterin-3 and Dendrobacillin
and of the Boverine Fungus on Bedbugs"

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 3, May-Jun 72, pp 63-67

Abstract: The toxicity of the standard bacterial preparations entomobacterin-3 and dendrobacillin to bedbugs was studied. The bedbugs were sprayed under laboratory conditions with aqueous suspensions of the preparations at concentrations of 0.5-2.0%, whereupon the length of time within which 90% of the insects perished was determined. The effect produced increased with increasing concentrations of the suspensions; it was generally the same for a 1.5% as a 2.0% suspension. The effect varied with the season, it was least pronounced in August, when the bedbugs were well-fed on blood, and more pronounced in March, when the bedbugs were underfed, and September, when their vitality was lower than in the summer. The action of the two bacterial preparations was similar, because both belonged to the same group of spore-forming and crystal-forming microorganisms, i.e., *Bac. thuringiensis*. The effective concentrations of boverine were in the 1-2% range and the optimum 1/2

May-Jun 72, pp 63-67

months for its application Jan and Sep, in which the humidity is highest and the physiological activity of the bedbugs is at the lowest level. A histological study was carried out on bedbugs that had been treated with 1-2% suspensions of dendrobacillin. Within 21-24 hrs after the treatment, sporiferous and crystal-forming bacteria were present in the insect bodies. Their greatest accumulation was in the outer fatty tissue, in the region of tracheae, between the malpighian bodies, and within and around the intestine. Gradually necrosis of the tissues in which the bacteria concentrated and destruction of the organs took place. The death of the insects after penetration of the crystal-forming bacteria into their body was apparently due to the action of bacterial toxins. On application of low doses of the bacterial preparations, septicemia predominated, while after application of high doses septicemia almost did not have time to develop. Entonobacterin-3 was obtained from the Agricultural Technology/Administration/ of the Kirgiz SSR, dendrobacillin from the Problem Laboratory of Irkutsk State University (Prof. Ye. V. Talalayev), and boverine from the Biological Method Laboratory at Minsk (T. T. Bezdenko, I. T. Korol), where it was prepared.

"Mechanism of the Inactivation of the Respiratory Chain by Cobra Venom Phospholipase"

Moscow, Biokhimiya, Vol 37, No 6, Nov/Dec 72, pp 1204-1209

Abstract: The effects of phospholipase A isolated from the venom of the Central Asian cobra on the respiratory chain of the succinate dehydrogenase system of submitochondrial particles and the NADH oxidase complex (I + III + IV) reconstructed from the cytochrome c-oxidoreductase (I + III) and the cytochrome of c-oxidase (IV) were studied. It was found that electron transfer was disturbed mainly at the level of cytochrome c in a link of the respiratory chain common to the NADH and succinate oxidase systems.

"Voltage-Code Converter"

Pribory i Sistemy Avtomatiki. Resp. Mezhved. Nauchno-Tekhn. Sb. [Automation Devices and Systems. Republic Interdepartmental Scientific-Technical Collection], No 13, 1970, pp 88-94 (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 10, 1970, Abstract No 10B273, by T. D.)

Translation: A dc voltage-to-binary 10-digit code converter is described. The converter is built of semiconductor devices and operates by digit-by-digit comparison. The principal error of the converter is not over $\pm 0.25\%$, the input impedance is 2 kohm, the speed is 2000 conversions per second, the voltage measurement range is 0-10 v. The converter uses "Mir-1" potential modules. The principal non-standard units of the converter determining its accuracy are made of high-stability elements. The compensator uses a wire-wound resister of manganin microwire, silicon transistors, and silicon diodes. A potential type null-balance device with a sensitivity of ± 3 mv is used.

POSTRADIOIODINE HYPOTHYREOIDISM

A. P. Stepanenko and N. V. Romashkan (Kiev)

The characteristic of hypothyreosis developing in 50 patients of the 1000 treated with I-¹³¹ for thyrotoxicosis are reported. Dosage of I-¹³¹ was 2-30 mCu. In 26 hypothyreosis developed within the first year of treatment, in the rest within 3-5 years. Both sexes suffered equally. The incidence was most frequent in the fourth decade but did not substantially depend on the dose. The incidence of hypothyreosis was more frequent in patients with a short history of thyrotoxicosis not previously treated with antithyroid drugs. Late development of hypothyreosis may be explained by gradual, slow reduction of the goiter size.

"A Study of the Reaction of p-Dibromodimagnesiumbenzene with Fluorocalkyl-(Aryl)chlorosilane"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 11, Nov 1971, pp 2,454-2,457

Abstract: Although the bifunctional Grignard reagents have become widely used in the synthesis of various organosilicon compounds, very little information has been published on their possible use in obtaining organofluorosilicone monomers.

In this connection, the reactions of p-dibromodimagnesiumbenzene with certain alkyl(aryl)chlorosilanes, containing 3,3,3-trifluoropropyl and α -trifluoromethylphenyl radicals, were studied, especially as regards the effect of various substitutions for the silicon atom in the chlorosilane. Also investigated was the optimal ratio of p-dibromobenzene and magnesium and the reaction time for assuring high yield of p-dibromodimagnesiumbenzene.

Thirteen monomers were produced with yields ranging up to 50%. Physical data are given for these, along with details of laboratory procedures.

"Primary Reaction of the Hypophysis-Adrenocortical System to the Action of Ionizing Radiation"

Moscow, Byulleten' eksperimental'noy biologii i meditsiny, No 8, 1972, pp 23-25

Abstract: Dynamics of changes in hormone formation and secretions in the adrenal glands of rats in the initial minutes and hours after irradiation were studied. 280 white male rats were subjected to 14 days of false radiation to accustom them to the experimental conditions. Rats were then divided into four groups: the control group subjected only to false radiation; the second, to a dose of 650 roentgens; the third, to 850; the fourth, to 1000. In the first group, it was found that there was practically no activation of hormone formation and secretions, indicating sufficient adaptation of the specimens to the experimental conditions. In the other three groups there was a two-phase activation of adrenal activity observed in the first few hours after irradiation. The first phase of renal reactions occurred in the first five minutes, while the level of corticosterone increased in the blood as well as the adrenal gland.

"The Growth of Particles of Hardening Phases in Processes Producing Dispersion Hardened Alloys"

Moscow, Fizika i Khimiya Obrabotki Materialov [The Physics and Chemistry of Materials Processing], No 6, Nov-Dec 73, pp 99-103.

Abstract: X-ray and electron microscope methods are used to determine the mean diameter of particles of the hardening phase in an alloy of nickel with three vol. % hafnium dioxide during stages of its production from an initial powder mixture of oxides to a compact deformed bar. The greatest growth of the mean particle diameter of the hardening phase is observed during the operations of sintering and hot extrusion. The main reason for enlargement of particles in processes involved in producing the dispersion hardened alloy is the unevenness of the distribution, allowing direct contact between particles. The electron microscope method is recommended for determination of the mean diameters of hardening-phase particles in a dispersion hardened alloy, since it gives more reliable information than the x-ray method.

"Recrystallization of Nickel Strengthened With Thorium Dioxide"

Moscow, Metallovedeniye i termicheskaya obrabotka metallov, No 3, 1972,
pp 36-40

Abstract: The study deals with the recrystallization of nickel strengthened with thorium dioxide following cold drawing and anneals of extruded metal powder rods. The material's composition was 96.89% Ni; 2.81% ThO₂; 0.07% C; 0.008% S; 0.003% P; 0.08% Fe; 0.037% Cu. Precipitation-hardened nickel has an extremely stable structure which explains the preservation of a considerable strengthening effect as a result of cold drawing after high-temperature annealing. The material features a wide temperature interval between the recovery occurring at 400-600°C and the recrystallization which develops at 1200-1400°C. On recrystallization, the precipitation-hardened nickel develops a structural inhomogeneity which is stable up to 1400°C. The amount of large recrystallized grains is governed by the preliminary deformation ratio and annealing temperatures. An increase in cold deformation activates the recrystallization of nickel strengthened with ThO₂.

"Interaction of Nickel With Samarium Hexaboride and Boron"

Kiev, Poroshkovaya Metallurgiya, No. 9, Sep 70, pp 80-86

Abstract: This study involved 99.7% pure carbonyl nickel powder and samarium hexaboride. The latter was obtained by the reaction $2\text{Sm}_2\text{O}_3 + 3\text{OB} \rightarrow 4\text{SmB}_6 + 3\text{B}_2\text{O}_2$. Alloys of both powders were subjected to x-ray diffraction and microstructure analyses, microhardness measurements of phase components, and quantitative analyses of both nickel and samarium. The interaction of nickel with samarium hexaboride indicates a dissociation of the latter to form SmB_4 . Depending on the nickel and hexaboride ratio in the initial mixtures, nickel borides are formed. Data on thermal and x-ray structure analyses of nickel and samarium hexaboride alloys, given in

1/2

USSR

ROMASHOV, V. M., et al, Poroshkovaya Metallurgiya, No. 9, Sep 70, pp 80-86

tables in the original article, suggest that the melting temperature of nickel boride is higher than that indicated by earlier researchers. An equilibrium diagram in the high boride domain of the Ni-Sm-B ternary system is proposed.

ABSTRACT. TWO QUARTZITES FOR MAKING
INDUCTION FURNACE CRUCIBLES WERE COMPARED AS TO THEIR ENDURANCE,
FRIABILITY, AND HEAT RESISTANCE: DOMESTIC AND SWEDISH, WHOSE COMPNS.
WERE SIO SUB2 98.10, 97.34, AL SUB2 O SUB3 0.59, 0.95, FE SUB2 O SUB3
0.31, 0.26, CAO 0.79, 0.26, MGO MINUS, 0.03, AND M SUB2 O SUB3
MINUS, 0.24, LOSS ON IGNITION 0.10, 0.46 WT. PERCENT, RESP. THE
CRUCIBLES MADE FROM THE DOMESTIC QUARTZITE WERE MORE FRIABLE AFTER
HEATING FOR 2 HR AT 1450DEGREES THAN THE SWEDISH CRUCIBLES, (PROBABLY
BECAUSE THE DOMESTIC QUARTZITE HAD MORE SIO SUB2), AND THE D. WAS 2.530
AND 2.360 G-CM PRIMES, RESP. THE ADDN. OF 1.0-2.0PERCENT OF B SUB2 O
SUB3 DECREASED THE D. TO 2.459, AND 2.330 G-CM PRIMES, RESP. THE
CRUCIBLES WITHSTOOD 321 AND 309 MELTINGS, RESP.

"Calculating Gunn Type Generators Under Conditions of Domain Suppression"

Moscow, Radiotekhnika, No 7, 1970, pp 39-47

Abstract: The author studies the effect of the parameters of a Gunn diode on its dynamic volt-ampere characteristic and derives power relationships for the design of Gunn type generators for conditions of domain suppression. The results show that the dynamic branch of the diode volt-ampere characteristic is determined by the magnitude of NL where N is donor concentration and L is crystal thickness. An analysis of the relationship between the coefficient of efficiency for the generator and the current supply shows that maximum efficiency is achieved when the current supply exceeds the threshold 1.6 times. Under these conditions, the load resistance should be 15-30 times greater than diode resistance at low voltage. The output capacity and efficiency of the generator increase significantly with increased mobility. Maximal efficiency reaches 6.15 percent at $7000 \text{ cm}^2/\text{v sec}$. The original article has 12 figures, 12 formulas, and 12 bibliographic entries.

ORGANIZATION AND PRACTICE OF COMPLEX PHYSICAL EXAMINATIONS ON THE
RURAL POPULATION OF TAMBOVSKAYA OBLAST

Article by G. R. Arshagyan, V. Romanovich, Chair of the Ural Institute of the Russian Academy of Medical Sciences, First Doctoral Student, Russian, No. 10, 1972, submitted 1 March 1972, pp. 227-228

In the current literature it is customary to submit information often appearing in the article of synthesis of the results, and much space. Thus, it is very important, particularly for specialists in medical practice, for the knowledge pertaining to organization of investigations to be the subject of discussion and even of special study.

In the present report we summarize the concrete experience gained in organizing and performing basic physicals on the rural population of Tambovskaya Oblast, which are a component of a special sociophysiologic study.

The study was conducted in 1970-1971 by the chair and local public health institutions. It was based on a specially developed method, which defined the objectives, tasks, and objects of investigation, which ensured maximum sample of the rural population. In particular, of the physical condition of the rural population, from two types of the objectives and tasks of the study a "card of medical and social survey of both a family and individual survey." The organizational principles of our work were based on 1) aid of local Party and Soviet agencies of institutions; 2) active involvement of public health agencies and community in the study.
