"Ship Antennas"

Sudovyye anteny (cf. English above), Leningrad, Izd. "Sudostroyeniye," 1972.  
424 pp. ill. 45 ref. 1 r 53 k.

Abstract: In the book methods are considered of investigation, design, and measurement, and problems of operation, prospects, and growth trends of ship antenna-feeder radiocommunication devices. The results are also presented of investigations and development of new types of ship antenna radiocommunication devices conducted in recent years, a considerable part of which was fulfilled with the direct participation of the author. The principles of construction of the antennas under consideration, the principal technical indices, design methods, and experimental data are stated. The book is intended for engineer-technical workers occupied with the development of ship antennas and radio apparatus, workers of planning organizations and steamship units, and it can also be of assistance in courses of antennas for students of higher educational institutions.

"Conditions of Binding Luminescent Compositions to a Substrate"

V sb. Sintez, ochildka i analiz neorgan. materialov (Synthesis, Purification and Analysis of Inorganic Materials--collection of works), Novosibirsk, "Nauka", 1971, pp 218-224 (from RZh-Khimiya, No 7, Apr 72, Abstract No 7L180)

Translation: The author studies the conditions of formation of luminescent deposits from silicate suspensions when the concentration of  $\text{SiO}_2$  in the suspension is approximately 0.05%. Fairly strong deposits with excellent structure are produced by using silicates with a modulus of 4 when the temperature of the suspension is about 20°C. The rate of polymerization of silicon dioxide in the working solutions increases with the modulus of the initial silicate. The rate of polymerization by strontium nitrate is a complex function of temperature. This is attributed to the effect of two opposing processes of depolymerization-polymerization of silicon dioxide in dilute alkaline solutions. Predominance of the first or second process depends on temperature. A relation is observed between the structure of a deposit of luminescent composition and the degree of polymerization of silicon dioxide in the working suspension before adding  $\text{Sr}(\text{NO}_3)_2$  to the suspension. Resumé.

"Nonstationary Interaction of Thermal Radiation and the Surface of Pure Metals"

Doklady Akademii Nauk SSSR, vol 206, No 1, 1972, pp 71-73

Abstract: Two pieces of experimental equipment for verifying the experimentally demonstrated temperature anomaly in the surface layers of metals subjected to sudden heating by a constant-density thermal flux are described. This anomaly is here defined as the deviation between the experimentally determined temperature of the surface and the theoretically determined value as obtained through the solution of the equation of thermoconductivity with limiting conditions of the second kind. One of these devices realizes the sudden heating, under vacuum conditions of  $6 \cdot 10^{-5}$  to  $5 \cdot 10^{-6}$  mm Hg, while the other realizes the heating in air. The densities of the absorbed heat fluxes were varied from  $5 \cdot 10^3$  to  $6 \cdot 10^4$  w/m<sup>2</sup> and from  $3 \cdot 10^2$  to  $5 \cdot 10^4$  for the two devices respectively. From their work with this equipment, the authors conclude that the anomaly is confirmed and that its dimensions are determined by the state of the surface and the microstructure

"Level Density of Compound Nuclei in the Region  $A = 130-200$  and Other Nuclear Properties"

Moscow, Yadernaya Fizika; July, 1972; pp 38-41

ABSTRACT: Recently at the VR-M reactor of the Institute of Nuclear Research of the Ukrainian Academy of Sciences some data on neutron resonance for a considerable number of nuclei over the range of mass numbers  $A = 130-192$  were obtained by the time-of-flight method. These data were used to calculate the level density of compound nuclei close to the excitation energy equal to the binding energy. This paper presents data on the dependence of the mean distance between levels for a fixed excitation energy as a function of the number of neutrons in a nucleus.

"Automation of Experimental Research in the Millimeter and Sub-  
millimeter Wavelength Ranges"

Novosibirsk, V sb. Konf. po avtomatiz. nauch. issled. na osnove  
primeneniya ETsVM, 1972 (Conference on Automation of Scientific  
Research Using the Electronic Digital Computer, 1972--collection  
of works) 1972, pp 100-101 (from RZh--Radiotekhnika, No 10, 1972,  
Abstract No 10A515)

Translation: The proposed research method is based on the visuali-  
zation of the field distribution in open structures (resonators,  
for example) by introducing into their space a test body which,  
entering a region of greater or lesser intensity in its motion  
along a specified trajectory, varies to some extent the parameters  
of the structures. The trajectory of the test body is traced by a  
beam on the screen of a cathode-ray tube. The brightness of the  
beam is proportional to the signal taken from the open structure.

"Influence of Magnesium on the Structure of Heat-Resistant Nickel-Based Alloys"

Izvestiya Akademii Nauk SSSR, Metally, No 4, Jul-Aug 73, pp 193-196.

Abstract: The influence of magnesium on the structure of nickel alloys was studied under the assumption that magnesium is concentrated primarily along the grain boundaries and in areas of other defects of the crystalline lattice. Assuming that a very slight concentration of magnesium could produce an excess of magnesium at these defect locations and thus hinder the separation of carbides and other excessive phases in these locations, facilitating their more even distribution through the entire volume of the alloy, the authors turned primary attention to the study of the influence of magnesium on the form, dispersion and nature of distribution of excess phases in the solid solution. It was found that the optimal addition of magnesium to heat resistant nickel-based alloys decreases dendritic liquation, makes the excess phases finer and facilitates their more even distribution. This

increases the technological plasticity and long-term strength of the metal.  
Excess alloying or enrichment of alloys with magnesium from the slag and  
lining in the furnace cause an increase in local chemical heterogeneity, in  
turn causing the appearance of new excess phases, decreasing the melting point  
of the metal in the area of these phases and reducing technological plasticity.

"Experimental Study and Calculation of a Turbulent Gas Flame"

V sb. Vopr. teorii goreniya (Problems of Combustion Theory--collection of works), Moscow, "Nauka", 1970, pp 51-70 (from RZh-Mekhanika, No 4, Apr 71, Abstract No 4B790)

Translation: An approximate method of calculating a free diffusion flame with separate concentric feed of fuel and oxidant is constructed on the basis of the method of the "equivalent problem of heat conductivity theory" (Vulik, L. A., Kashkarov, V. P., Teoriya struy vyazkoy zhidkosti [Theory of Viscous Liquid Jets], Moscow, "Nauka", 1965; RZh-Mekh, 1966, 5B508K). From the experimentally known drop in dynamic head along the axis of the flame and the predetermined value of the turbulent Prandtl number, the distribution of all parameters in the flame may be determined. An analytical solution is obtained with certain assumptions which are not later confirmed. The authors present the results of an experimental study of a diffusion flame formed by coaxial jets. The dynamic head, temperature and

1/2

VERTLIB, I. L., ARUTYUNOV, V. A., Vopr. teorii goreniya, Moscow, "Nauka", 1970, pp 51-70

concentration of reagents are measured in the flame field, and oscillograms of the ionization current are analyzed. The results of exact numerical calculation did not agree as well with the experimental data as did the approximate analytical relationships. The nature of the effect of certain initial conditions with respect to the data of calculations is not always in accord with the experimentally determined effect. V. A. Frost.

"Experimental Study and Calculation of a Turbulent Jet Formed by Coaxial Jets of a Gas and an Oxidizer"

V sb. Protsessy v plameni prom. pechey (Processes in the Flame of Industrial Furnaces -- Collection of Works), Moscow Institute of Steel and Alloys, Vol 58, Moscow, 1969, pp 21-36 (from RZh-Mekhanika, No 5, May 70, Abstract No 5B982)

Translation: The results of a detailed experimental and computational-theoretical study of a free turbulent diffusion jet formed by coaxial jets of a hot gas in air are presented. The method of the "equivalent problem of the theory of heat conductivity" is used as a computational method in the paper and reduces to a calculation of continuous velocity profiles, temperature and reagent concentrations and also of the coordinates of the flame front by integrating the linear equations. The empirical relationship of the reduced  $\psi$  and the actual  $x$  of the longitudinal coordinate was borrowed from experiment by comparing theoretical and experimental curves for the change

Moscow Institute of Steel and Alloys, Vol 58, Moscow, 1969, pp 21-36

in the characteristic values on the axis of the jet. The feature of the singularity of the solution (permitting, apparently, the authors to obtain good agreement between computation and experiment) reduces to the computer solution of a transcendental equation for the coordinates of the flame front. The experiments were conducted on a coaxial burner ( $d_{in} = 18$  mm,  $d_{ext} = 26, 30$  or  $34$  mm); a mixture of the hot gas with its combustion products in air was placed in the inner tube and air was placed in the outer tube. The values of the dynamical pressure, concentrations, temperature and electrical conductivity were measured; the two latter measurements gave practically identical values for the coordinates of the flame front; photographs were also taken of the jet with different exposures. The initial conditions were varied: the methane concentration in the fuel flow, flow rate, etc. It was evident from the experiments that other conditions being equal the maximum length of the jet corresponds to equality of the values  $\rho u^2$  at the output for both flows; the minimum value of the length corresponded to a flow of gas in motionless air. The results of the experiment agree with the calculation so that for the experimental conditions a single graph is shown for the relationship  $\psi(x)$ , the computational "key" and the equivalent problem method. 11 references. "A Device for Suppressing Signals of One Frequency"

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, No 12, Apr 71, Author's Certificate No 299974, Division H, filed 5 Aug 68, published 26 Mar 71, p 214

Translation: This Author's Certificate introduces a device which suppresses signals of one frequency in a signal transmission channel. The device contains a transformer, resonance circuit and balance resistor. As a distinguishing feature of the patent, the unit is designed to give a high base signal transmission ratio, reduce nonuniformity of the frequency response of the channel, and narrow the suppression frequency band while achieving a high coefficient of suppression and weakening the relationship between the transmission ratios and coefficient of suppression on the one hand and load impedances on the other combined with simplification of the suppression circuit. The transformer contains an additional winding which is symmetric with the main winding and has a common point with the main winding, the outer ends of the auxiliary and main windings being interconnected through the above mentioned resonance circuit and balance resistor. The input of the circuit

1/2

· VERTLIB, M. Ya., GORDON, F. G., USSR Author's Certificate No 299974

is the common point of the main and auxiliary windings and the point where the resonance circuit is connected to the balance resistor. The load resistor is connected to the output winding of the transformer.

"Centrifuging of Siluminum in the Liquid State"

Moscow, Doklady Akademii Nauk SSSR, Vol. 190, No. 2, 1970, pp 313-314

Abstract: An alloy of aluminum and silicon was centrifuged in a high-temperature vacuum device in order to obtain information on the structure of the alloy. The siluminum samples were centrifuged at temperatures of 700 and 850°C. The samples were analyzed for silicon content by a weighing method along the longitudinal axis. The distribution of silicon in the samples of both series is graphed. Analysis shows that the effect of crystallization on the separation of the components of the alloy in the centrifuged field was slight under these experimental conditions. Increasing the temperature from 700 to 850° reduced the degree of separation of the components of the aluminum-silicon system. It is concluded that this effect is possible only if one assumes the presence in the Al-Si system of dynamic subgroups enriched by one of the components of dimension  $r = 10-50 \text{ \AA}$ . These results should be considered in studying the modification and crystallization of silumins.

ANTITUMOR ANTIBIOTIC TAVROMYCETIN, ITS EFFECT ON ORGANS AND BLOOD  
OF EXPERIMENTAL ANIMALS, DISTRIBUTION AND EXCRETION

Vertogradova, T.P.; Kunrat, I.A.; Muraveyskaya, V.S.

Institute for New Antibiotics, Academy of Medical Sciences of the USSR, Moscow

The paper presents data on the effect of tavrromycetin on the organs and blood of experimental animals, its distribution in tissues and excretion. It was found that tavrromycetin used in toxic doses affected the liver and the kidneys of the animals, decreased the erythrocyte and hemoglobin counts in the peripheral blood and induced thrombocytopenia. After intravenous administration 0.5 per cent of the antibiotic was excreted with urine and 4-5 per cent with bile. After oral administration 0.8-1 per cent of the antibiotic was excreted with bile and no antibiotic was detected in urine.

"Electrical Resistance of Powder Metal Tungsten-Rhenium Alloys"

Kiev, Poroshkovaya Metallurgiya, No 10, Oct 72, pp 68-70

Abstract: The concentration and temperature relationships of electrical resistance were investigated for W-Re alloys within the limits of the tungsten solid solution. Powder metal alloys containing 5, 10, 19, 20, 21, and 27% Re were used in the 1200-3000°C temperature interval. Analysis of measurement data shows that the relationship of electrical resistance for W-Re alloys in the investigated range of compositions basically conforms to the Nordheim law, i.e., electrical resistance has a linear function to the product of atomic concentrations. Alloys with 20 and 21% Re deviate from the general principle, starting at approximately 1700°C. The formation of intermediate phases is assumed to be the cause of this anomaly.

The authors thank V. M. AMOSOV and Ye. I. PAVLOVA for useful observations during the discussion of the results obtained. 3 figures, 12 bibliographic references.

"Thermal and Electric Conductivity of Tantalum at High Temperatures"

Moscow, Teplofizika Vysokikh Temperatur, Vol 10, No 1, Jan-Feb 1972, pp 77-81 .

Abstract: The author studies the thermal and electric conductivity of tantalum at high temperatures. The thermal conductivity of tantalum was measured at 1400-3000°K with an error of less than 2.5-4.5 percent. Its electrical resistance was measured at 1200-3000°K with an error of less than 1 percent. A deviation is determined from the monotony of the second derivative of electrical resistance with respect to temperature in the 2100°K range. The author uses data from existing literature to calculate the most probable values of thermal conductivity and electrical resistance. Original article: six formulas, five figures, one table, and 20 bibliographic entries.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. MEASUREMENTS HAVE BEEN PERFORMED ON WIRE SPECIMENS HEATED BY PASSING ELECTRICAL CURRENT IN VACUUM. USE HAS BEEN MADE OF EXPONENTIAL TEMPERATURE DISTRIBUTION GRADUALLY DISPLACED ALONG THE SPECIMEN DUE TO THE RIDER TEMPERATURE VARIATION. THE EXPONENT HAS BEEN DETERMINED FROM THE COMPARISON OF THE RESISTIVITY CHANGE OF TWO SPECIMEN SECTIONS WITHOUT USING THE TEMPERATURE COEFFICIENT OF ELECTRICAL RESISTIVITY. RESISTANCE BRIDGE HAS ALSO BEEN USED. TUNGSTEN THERMAL CONDUCTIVITY HAS BEEN DETERMINED FOR THE TEMPERATURE INTERVAL OF 1300 TO 2500DEGREEK ON THE SPECIMENS OF 99.9PERCENT PURITY WITH 0.1PERCENT ADDITION OF MO. THE CALCULATED MAXIMUM RANDOM ERROR OF A SINGLE MEASUREMENT DOES NOT EXCEED 6PERCENT.

GROWTH KINETICS AND MORPHOLOGY OF AUTOEPITAXIAL GERMANIUM FILMS IN THE CHLORIDE METHOD

All-сравнительно исследования по кинетики  
Article by V. S. Kravchenko, A. A. Andreyeva, V. N. Voznesenskiy, P. A. Kuznetsov, N. A. Stetsko, Professor Boris I. Strukova, Мемориальный Музей Германов  
Полупроводников -- Индустриальный Музей, Москва, Part 7, 1969, pp 165-186

The quantitative results of experimental studies of the growth of autoepitaxial layers of germanium by the chloride method (1-4) cannot be used for other setups without preliminary analysis which must include the investigation of mass transfer phenomena, reaction equilibrium and kinetics. In the investigation reactions intermediate reactions take place in the gas phase (5-7). The area of the occurrence of which essentially affects the growth processes and, in turn, depends on many parameters and electrical elements of the reactor. Therefore, the necessary condition of optimal process and its realization are a further experimental study of the chemical system Ge-Cl-H<sub>2</sub>. This study, in addition, can permit an approach to the discovery of the mechanism of the reactions on the surface and the growth mechanisms under different conditions and, perhaps, it will offer the possibility of more purposeful utilization of the growth process of the autoepitaxial layers.

In this paper a study was made of the effect of the temperature, the vapor-gas mixture on the growth kinetics and morphology of the films. The local reactor 72 mm in diameter was used. The heating was realized by high frequency induction current. The temperature was measured by a platinum-platinum-rhodium thermocouple, and it was kept constant (variations within the limits of ±2 degrees). The substrates with (111) orientation were used.

Just as any heterogeneous process realized in the flow, the growth process of the germanium films from the gas phase as a function of the changing slope can be divided into several regions.

For very small flows where the equilibrium can be established on the surface and in the gas phase or under the conditions of complete mixing the process takes place in the so-called quasiequilibrium range (8). In this case the growth rate is the linear function of the flow velocity and can be calculated by the formula (9)

XV-1. STUDY OF THE REAL MICROSTRUCTURE OF GROWTH AND SOLUTION SURFACES BY THE LIGHT CONFIGURATION METHOD

Article by V. N. Vertoprakhov, V. B. Zamiatyly, V. P. Sirov'yeva, Novosibirsk Novosibirsk. *Izv. Sibirskogo nauchno-issledovatskogo tsentra SSSR po fizicheskoi khimii i kristallografii*, Novosibirsk, 12-17 June 1972, p 218

The method of light configuration used at the present time to orient crystals along the principal crystallographic axes can in reality give rather information about the growth or solution surface. The lines and bands on the light configurations are diffraction spectrum systems and bear information about the nature of growth and solution steps.

In the case of layered growth of the crystals on the facets frequently vicinal forms occur which are deflected by a fraction of an angular degree from the basic facet. By using a laser beam it is possible to determine the angles of vicinal forms with an accuracy to several seconds. Thus, it is possible to determine the angles of disorientation of individual blocks resulting from the surface.

In the case of complex structure of the surface, the light configurations are frequently strongly diffuse, and it is difficult to determine the exact angular value of one facet or another by them. In this case a good result is obtained by the effect of overexposure of the photographic screen known by the name of the polarization phenomenon.

What has been discussed is illustrated in an example of semiconductor crystals with a structure of the type of diamond, spherulite or lamell.

ABSTRACT. THIS AUTHOR'S CERTIFICATE INTRODUCES A PARAMETRIC AMPLIFIER WHICH CONTAINS A BALANCED CAPACITANCE MODULATOR BASED ON FOUR BLOCKED DIODES, A PUMPING OSCILLATOR WITH MASTER CIRCUIT, A SELECTIVE AMPLIFIER AND AN AMPLITUDE DETECTOR. IT DIFFERS BECAUSE TO INCREASE THERMAL STABILITY AND SIMPLIFY TUNING, THE CAPACITANCE MODULATOR IS CONNECTED THROUGH ITS INPUT DIAGONAL INTO THE INDUCTANCE CAPACITANCE RESONANCE CIRCUIT OF THE AMPLIFIER, AND AT THE SAME TIME IS CONNECTED THROUGH ITS FEED DIAGONAL TO THE TANK OF THE PUMPING OSCILLATOR. THE INDUCTANCE AND CAPACITANCE OF THIS TANK ARE EQUAL IN AMPLITUDE TO THE ANALOGOUS ELEMENTS OF THE AMPLIFIER TANK CIRCUIT.

"A Parametric Amplifier"

USSR Author's Certificate No 262982, filed 4 Nov 68, published 2 Jun 70 (from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12030 P)

Translation: This Author's Certificate introduces a parametric amplifier which contains a capacitive balanced modulator on four blocked diodes, a pumping oscillator with master circuit, a selective amplifier and an amplitude detector. To increase thermal stability and simplify tuning, the above-mentioned capacitive modulator has its input diagonal connected in a resonance capacitance-inductance tank in the amplifier, and the feed diagonal is connected in the resonance tank of the pumping oscillator; the inductances and capacitances in the amplifier and oscillator tank circuits are equal in value.

"Parametric Low-Frequency Resonance Amplifiers. A Survey"

V sb. Entsikloneidiya izmereniy kontrolya i avtomatika. (Encyclopedia of Monitoring and Automation Measurements--collection of works), Vyp. 14, Moscow, "Energiya", 1970, pp 27-30 (from RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10D290)

Translation: The authors present a survey of works on the most promising low-noise, low-frequency amplifiers -- parametric resonance amplifiers. Low-frequency parametric resonance amplifiers of the capacitive type (based on blocked PN junctions) and the inductive type (based on ferrites and thin films with orthogonal magnetic control) are discussed. Expressions are given for the gain, passband and noise factor of the amplifiers. The basic problems of developing low-frequency parametric amplifiers are considered: selection of reactive elements, pumping oscillator, means of preventing the effect of the second harmonic, change in reactance, etc. Five illustrations, bibliography of thirty titles. Resumé.

"High-Temperature Electron Microscopy"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol 36, No 6, 1972, pp 1266-1271

Abstract: The article shows that high-temperature studies can be performed in an electron microscope by using the electron beam of the microscope to heat objects. The specimen support is an apertured disk made of tungsten foil, mounted in a socket covered with a heat-insulating layer of aluminum oxide. The heating of the disk is accomplished by a defocused electron beam, a slight portion of which passes through a hole in the disk and creates an image of the object. The temperature is measured by means of an optical pyrometer, focused on a mirror replacing the intermediate screen of the microscope. The principal difficulty in measuring temperatures above 1000° C is that the temperature is not the same for various sections of the disk due to nonuniformity of the current density. At temperatures ranging from room temperature to 2000° C the temperature measurement error does not exceed several dozen degrees. The maximum heating temperature depends on the properties of the disk material and object and can exceed 3000° C.

No 8, Mar 71, Author's Certificate No 296091, division G, filed 17 Oct 68,  
published 12 Feb 71, p 148

Translation: This Author's Certificate introduces a pneumatic computer which contains a single-diaphragm element with two nozzles which are coaxial with each other in the flow chamber of the element. The dead-end chamber of the element is connected to a multiplicand pressure source, and the inner nozzle is connected through a choke to a multiplier pressure source and directly to the output channel of the device, the annular channel formed by the nozzles being open to the atmosphere. As a distinguishing feature of the patent, the functional possibilities of the computer are extended by connecting the flow chamber of the element through a choke to a divisor pressure source.

"One Possibility of Error-Free Recognition of a Limited Setup of Commands"

Tbilisi, Soobshcheniya Akademii Nauk Gruzinskoy SSR, Vol 65, No 1, Jan 72, pp  
41-44

Abstract: A two-step algorithm is proposed for the recognition of a limited setup of commands. The logic algorithm proposed for the first step uses so-called MINI- and MAXI-portraits as standards, while for the second recognition step there is a scalar product algorithm with a heuristic standard. The first-step algorithm permits error-free recognition of about 70 percent of the realizations presented for recognition, while the remaining realizations are also recognized without error by the second-step algorithm.

"High-Frequency Noncontact Study of Temperature Dependence of Electrical Properties of Ionic Crystals"

Tr. In-ta elektrokhimii. Ural'sk. nauch. tsentr AN SSSR (Works of Electrochemistry Institute, Ural Scientific Center of Academy of Sciences USSR), 1971, vyp. 17, pp 7-10 (from RZh-Fizika, No 1, Jan 72, Abstract No 1YE1226 from summary)

Translation: The authors study the electrical properties of NaCl, KCl, CsCl, KBr, and KI crystals by the noncontact HF method. It is established that on the curve for the temperature dependence of the tangent of the angle of dielectric loss in the crystals studied there is a maximum near the melting points. In the case of CsCl a maximum is found also in the region of polymorphous  $\alpha \rightarrow \beta$  transformation at 475° C. The presence of a maximum on the  $\tan \delta$  curve is due to mutually opposed processes: an increase in the concentration of defects and a decrease in their mobility. The  $\tan \delta$  temperature dependence can be regarded as characteristic of temperature variations in the structure of ionic crystals.

"The Effect of Protracted Darkness on the Metabolism and Viability of *Chlorella* Sp. K."

Leningrad, Vestnik Leningradskogo Universiteta, No 21, Biologiya, No 4, 1970, pp 121-129

Abstract: Metabolic shifts in *Chlorella* sp. K. cultured on a medium deficient in organic nutrients and kept in the dark for a period of two months were studied. Before the beginning of the experiment, algae in suspension were cultured on a mineral medium under luminescent lamps, and continuously aerated by air containing 5% CO<sub>2</sub>. The biomass was then centrifuged, resuspended on a culture medium deprived of KNO<sub>3</sub>, poured into 3-liter conical glass vessels and placed in the dark. The suspension was aerated at the rate of 0.8 l/min. Samples for analysis and determination of the cell content in millions per milliliters, dry matter in grams per liter, and the chemical composition of the biomass were periodically obtained. The data obtained revealed that *Chlorella* sp. K. cells are highly resistant to dark conditions. Despite the deficiency of organic nutrients

NUCLEASES OF ACTINOMYCETES BELONGING TO THE BLUE GROUP

*Institute Microbiology, Academy of Sciences USSR*

Investigations of the blue group actinomycetes has shown that the cultural fluid of the strains pertaining to this group displays nuclease activity which differs in the case of different strains. Some strains produce a thermostable nuclease which retains its activity after heating in an acid medium.

The enzyme produced by other strains is destroyed by heating and may be regarded as a phosphodiesterase. Many other strains displayed a partial activity decrease following heating suggesting that these strains produce several different nucleases. All strains checked with respect to their DNA activity have shown their ability to split this compound.

QUANTITATIVE PROCEDURE FOR *TREPONEMA PALLIDUM* IMMOBILIZATION TEST

L. V. Sazonova, L. D. Verzhilova

Summary

A method of quantitative *Treponema pallidum* immobilization test has been developed using increasing amounts of the serum to be examined (0.05—0.1—0.15—0.2 ml) with appropriate controls. The other components of the test are used in conventional amounts of the qualitative *T. pallidum* immobilization test. The experience with the new method indicates that increasing the amount of the inactivated serum under study does not produce immobilization of *T. pallidum*.

For more accurate serodiagnosis of syphilis and in differentiation of false positive results of standard serological tests it is necessary to examine larger amounts of sera by the quantitative method of *T. pallidum* immobilization test. Increased amounts of inactivated serum from subjects with questionable results produces more complete immobilization of *T. pallidum* and more definite results of *T. pallidum* immobilization test.

"Segregation Microheterogeneity in 4Kh12N3G8MFB (E1481) Heat-Resistant, Electroslag-Remelted Steel"

Moscow, Metallovedeniye, No 9, Sep 72, pp 70-72

Abstract: A comparative analysis was made of intracrystalline segregation in ingots of a 13-8-8 austenitic steel (E1481) produced by open-arc melting followed by electro-slag remelting. The composition of the remelted steel was (in %): 0.39 C, 0.41 Si, 13.4 Cr, 8.2 Mn, 8.0Ni, 1.4 V, 1.3 Mo, and 0.45 Nb. The degree of dendritic heterogeneity was evaluated by the coefficient of segregation  $K_s$ , which is the ratio of maximum concentration of an element to the minimum concentration of the element in a dendritic cell. The steel was made at the Elektrostal' Plant in a 20-ton electrical furnace. The resulting electroslag remelted ingot weighed 3200 kg. It was found that E1481 steel, alloyed with strong carbide-forming elements and carbon, experiences inter-axial segregation of the basic components. The segregation heterogeneity is determined by the nature of the macrostructure, and the maximum heterogeneity was the same for both the open-arc and electroslag melted steel. 1 figure, 1 table, 5 bibliographic references.

Translation: Several special installations were constructed to study shield-  
ing. The BSF and GTR installations were swimming pool reactors employing  
1 and 3 Mw neutrons, respectively, placed on moving bridges in large water  
pools. The B-2 device on the BR-5 reactor was developed to study the laws  
of the attenuation of  $\gamma$ -quanta and reactor neutrons in the geometry of a  
unidirectional beam; the materials to be studied or models of the shielding  
were placed in a niche in the reactor shielding. A zero-power reactor was  
intended for studying processes in the shield directly adjacent to the  
reactor core. The reactor was equipped with filters in one of the directions  
making it possible to obtain an optimal relationship between the neutron

Translation: Current designs of the shielding of nuclear reactors include hydrogen-containing materials, the presence of which in the shield makes it possible to shorten the size of the shielding and reduce the contribution to the power of the dose from neutrons of intermediate energies. Various hydrogen-containing materials are used in the shield: water, polyethylene, paraffin, concretes with an increased concentration of hydrogen such as Serpentinite concrete, etc. Metal hydrides may also be included in such materials. Metal hydrides have a high nuclear density of hydrogen, in some cases exceeding the nuclear density of hydrogen water. In studying the passage of neutrons through metal hydrides, one can show the perturbing

"Magnetic Materials For Sealed Magneto-Controlled Contacts"

Moscow, Pribory i sistemy upravleniya, No 11, Nov 1971, pp 37-38

Abstract: The paper lists the requirements imposed on the contact springs of magneto-controlled contacts (MC) and discusses the alloys (47NK, 47ND, 35NK) for MC developed at the Institute Of Precision Alloys of the Central Scientific-Research Institute Of Ferrous Metallurgy (TsNIIChM), with an increased value of the induction in a 640 a/m field, which assures high-speed operation of such MC and increases their sensitivity. These alloys assure a vacuum-tight durable seal with glass and a coefficient of thermal expansion close to that of glass in the interval from 20 to 500° C. The binary alloy 52H can also be used for MC. The magnetic and mechanical properties of the new alloys developed at TsNIIChM are shown as well as those of 52N. 3 ref. 2 fig. 2 tab.

ELECTROCARDIOGRAPHIC SIGNS OF PULMONARY  
HYPERTENSION

L. V. Vesel'nikov

Summary

An attempt is made to evaluate the informative significance of electrocardiographic signs of hyperfunction of the right ventricle in the diagnosis and cardiogenic pulmonary hypertension. In 70 per cent of observations these tests are of diagnostic importance, including quantitative. Of the greatest value is the ratio between the factual values of  $R/Sv_1$  and the ratio of their maximal values exceeding one (a sign proposed by the author).

"Efficient Identification of Pathogenic Intestinal Microbes"

Moscow, Laboratornoye Delo, No 9, 1971, pp 542-543

Abstract: "Suspicious" colonies are cultured on Glycerin-bile agar to which dysentery, typhoid, and Salmonella bacteriophages are added. A positive identification can be made immediately in the case of Sh flexneri or sonnei cultures provided that all the typical characteristics are present. Both strains make up the majority of the Shigellas and E. coli. All the S. flexneri strains are lysed by the dysentery bacteriophages and somewhat fewer by the typhoid bacteriophages. Sh. sonnei is lysed by the same phages in about 85% and 60% of the cases. The identification of Sh sonnei cultures is facilitated by the fact that when grown on glycerin-bile agar, the R-form appears.

"Study of Staphylococcus Toxicity by the Diffusion Precipitation Method"

Moscow, Laboratornoye Delo, No 3, 1971, pp 178-180

Abstract: Instead of the cumbersome test-tube method, the author proposes the use of a special agar medium developed by the Dagestan Institute of Culture Media. The agar is poured onto 20-ml dishes and allowed to congeal, after which sterile filter paper moistened with antistaphylococcus serum is applied to the surface. Then four of the Staphylococcus strains under study are inoculated onto each dish, alternating them with a standard Staphylococcus culture. Most of the pathogenic strains tested formed precipitation lines, whereas none of the nonpathogenic strains did. Coagulase was found in all of the pathogenic strains, toxigenicity in 94.1%, and hemolysis in 87.8%, i.e., toxin formation was most frequently associated with coagulase activity. The three main characteristics of pathogenicity - presence of coagulase, toxin, and hemolysin - were combined in 83.4% of the pathogenic strains. The diffusion precipitation method was successfully used to establish the antigenic identity of Staphylococcus strains isolated during an outbreak of Staphylococcus poisoning in a restaurant.

"Calculation of an Open Dielectric Wave Guide of Rectangular Cross Section"

Gor'kiy, Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika, Vol XIV, No 12, 1971, pp 1891-1901

Abstract: The method of partial regions is used to solve the problem of propagation of electromagnetic waves along a regular rectangular dielectric wave guide in an unlimited homogeneous medium. The dispersion equations are obtained which determine the propagation constants of all types of surface waves that can exist in the investigated system. The dispersion curves for the even wave of the dipole type  $(HE)_{11}^{even}$  are calculated on the basis of the approximate equations. A comparison is made with the results obtained by other methods [Goell, Bell System Technical Journal, Vol 48, No 7, 2133, 1969]. Tables of special auxiliary functions simplifying the practical calculations on the basis of the dispersion equation of the first approximation are presented. The possibility of calculating the parameters of a rectangular dielectric wave guide by the proposed equations is proved.

"Designing a Circular Waveguide with an Inner Cruciform Conductor"

Moscow, Radiotekhnika, Vol. 25, No. 11, 1970. pp 102-104

Abstract: The inner conductor of this waveguide, which is asserted to be practically useful because of its favorable range and directional characteristics, extends the length of the guide and has a cross section in the shape of a plus sign. Under the assumption that all conductors are ideally conductive and that the thickness of the inner conductor cross arms is infinitely small, the authors of this brief communication find the critical H and E conditions of the system through the method of partial regions. Curves are plotted for the critical frequency reduction factor and for the relative error in that factor as functions of the ratio  $a/b$ , where  $a$  is half the length of the cross arm and  $b$  is the inner radius of the waveguide.

"Characteristic Oscillations in an Infinite System of Open Dielectric Waveguides"

Moscow, Radiotekhnika, Vol 25, No 8, 1970, pp 52-58

Abstract: Open dielectric waveguides have received wide attention in antenna-waveguide technique for use as smooth delay systems. The purpose of this paper is to obtain a rigorous solution to the problem of an infinite system of equidistant and coplanar waveguides of this type. The authors consider the system cross section involving the following parameters: the waveguide radius, the distance between the axes of neighboring waveguides, the parameters of the waveguide material, and the parameters of the surrounding medium. Finding the components of the electromagnetic field in the waveguides, they derive expressions for the field and obtain the dispersion equation determining the propagation constants of the characteristic oscillations. They show that, with an increase in the distance between the waveguides, the dispersion equation transforms to an equation for various types of waves in a uniform open dielectric waveguide. The relationships and dispersion characteristics they obtain for the fundamental asymmetrical wave through an approximation equation may be useful for determining the electrodynamic characteristics of a system of closely spaced waveguides. 1/1

with respect to a complete system of scalar functions satisfying the wave equation in the cylindrical coordinate system, and for the external multiply-connected region, also the boundary conditions at infinity. Graphs are presented for the dependence of the delay factor on the distance between the axes of the dielectric waveguides in wave lengths for lower asymmetrical types of waves polarized in the vertical plane. The discussed method is used when solving the problem of characteristic oscillations of infinitely ordered systems of dielectric waveguides -- a two-dimensional-periodic grid. The calculational relations are presented for the wave delay factor of a system of equidistant dielectric waveguides arranged in a single plane as a function of the radius, distance between axes of adjacent dielectric waveguides and phase shifts. The case of lower asymmetrical waves of the  $HE_{11}$  type is investigated. There are two illustrations.

"On the Theory of a Round Wave Guide with an Eccentrically Placed Metal  
Conductor"

Moscow, Radiotekhnika i Elektronika, Vol. 15, No. 4, April 1970, pp. 815-818

Abstract: The authors apply the method of partial regions to derive expressions for the critical conditions of a coaxial transmission line with an off center central conductor. In these calculations they assume a metal conductor inside a metal screen, the space between them being filled by a uniform isotropic medium. The process of derivation is as follows:

- 1) The longitudinal components of the electromagnetic field are expressed as series in complete systems of electrical and magnetic scalar functions; these involve linear combinations of Bessel and Neumann functions, taking into account the zero Dirichlet and Neumann boundary conditions at the surface of the central conductor, but not the screen.
- 2) Apply the zero Dirichlet and Neumann conditions at the surface of the screen, using the orthogonal relationships for exponential functions to

1/3

USSR

VESELOV, G. I., et al, Radiotekhnika i Elektronika, Vol. 15, No. 4, April 1970, pp. 815-818

determine the desired theoretical values in the form of infinite determinants.

3) Applying the supplementary boundary conditions in the plane of symmetry of a coordinate system centered in the conductor, determine the longitudinal components of the electromagnetic field for either an electrical wall or a magnetic wall.

4) Combining Bessel functions and applying the zero boundary conditions at the screen surface and in orthogonal relationships for trigonometric functions, determine the critical conditions for a circular wave guide with a metal conductor displaced in the plane of the electrical or magnetic wall.

All the expressions given are in the form of infinite series which converge fairly rapidly; the authors give an example in which they calculate the critical parameters of a circular wave guide with an eccentric internal conductor for oscillations of the  $kE_{01}$  type (displacement of the conductor in the plane of the magnetic wall) and the  $kE_{11}$  type (displacement of the conductor in the plane of the electrical wall). They found that the displacement of the internal metallic conductor leads to a substantial reduction in the critical frequency for  $kE_{01}$  and  $kE_{11}$  oscillations. An analysis of the convergence process indicates that the relative error of calculation in the  $\frac{2}{3}$

Abstract: In the interpretation of aerial photographs obtained on SN-6 spectralzone film, insufficiently clear color separation of standing timber on the basis of species is observed; this has to do with the nature of the aerial film. In order to ascertain the color-separation potentialities of this film, color-separation tests were undertaken. It was, however, impossible to use the existing methods, since the procedure was complicated by the fact that one of the layers of SN-6 film registers infrared radiation. Therefore a special procedure was worked out. This procedure is described in the article. 5 figures. 7 bibliographic entries.

"Adsorption Kinetics in a Stationary Wave"

Moscow, Teoreticheskiye Osnovy Khimicheskoy Tekhnologii, Vol 4, No 3,  
May-Jun 1970, pp 343-351

Abstract: Adsorption from a flowing fluid by a layer of motionless granulated adsorbent is a non-stationary diffusion process. However, an adsorption wave forms in which the rate of mass transfer at every level becomes stationary once the wave has become stabilized. One can therefore treat adsorption in the wave as a stationary mass-transfer process. A method has been developed for studying adsorption in a wave by applying this principle. Equations were derived for determining the coefficients of mass transfer in various sections of the adsorption wave. These equations were applied in studying changes in the resistance to mass transfer over the length of an adsorption wave formed in the separation of a liquid benzene - n-heptane mixture passed through a layer of silica gel. In the study conducted, data obtained in the experimental separation of this mixture on silica gel were used.

102349z Vapor conversion of a gasoline raffinate under pressure. Veselov, V. Ya.; Meshenko, N. T.; Tsimbalistava, N. N. (Inst. Gaza, USSR). Khim. Tekhnol. Topl. Masel 1970, 15(2), 13-17 (Russ). During steam conversion of a dearomatized platformate gasoline, b. 43-136°, introduced as a 1:5 gasoline-steam mixt. at a vol. rate of 1 hr<sup>-1</sup> onto a 1:1 Ni-Cr catalyst at 320°, an increase in pressure from 1 to 31 atm reduced H content in the product from 62.0 to 31.5% and raised CH<sub>4</sub> content from 15.2 to 43.1% without substantially changing CO<sub>2</sub> content. The limiting feed rate for complete gasification increased linearly from 1.7 to 4.4 hr<sup>-1</sup> as the pressure was increased from 1 to 20 atm. At 20 atm and otherwise identical conditions, a change in input rate from 1 to 5 hr<sup>-1</sup> did not appreciably affect product compn. At an input rate of 4.4 hr<sup>-1</sup>, a temp. increase from 200 to 320° raised conversion from 20 to 100%. When H was the desired product, purer H and higher efficiency were attainable by carrying out the process in 2 stages, the first an adiabatic one at low temp. in a flow reactor and the second a H production process in a tube furnace, the first section of which was operable with the converted feed at 700-800° without carbonization of the catalyst.

"Maximal Dynamic Characteristics of an Adsorbent"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 45, No 10, Oct 72, pp 2201-2204

Abstract: In earlier papers the author covered the concept of the maximum values of dynamic characteristics of the separation power of an adsorbent. This concept was used in developing a qualitative basis for the theory of adsorption separation. The maximum value of dynamic separation is defined as the maximum quantity of a substance isolated from a mixture per 1 g of the adsorbent under ideal conditions of dynamic adsorption. Several questions were apparently left unanswered in the earlier papers, and in the present work the author aims to clarify them. The first concept considered by the author concerns the separation power of an adsorbent which normally can be determined experimentally or calculated from experimental data on static adsorption. This is a very practical consideration often missed by other investigators. Further, the author points out the obvious differences between the "separation power of an adsorbent" and "adsorption", which appear to be confused by many investigators. Finally an explanation is given why the separation power with respect to component A is smaller than the entire content of this component in the adsorption volume a.

ABSTRACT. THE SYSTEM CONSISTING OF THREE CHARGED PARTICLES IS CONSIDERED. THE REGULAR SYSTEM OF INTEGRAL EQUATIONS FOR THE BOUND STATE SCATTERING PROBLEM BELOW THE IONIZATION THRESHOLD IS OBTAINED. THE KERNELS OF THESE INTEGRAL EQUATIONS ARE EXPRESSED IN TERMS OF THE SOLUTIONS OF THE CORRESPONDING TWO BODY PROBLEMS ONLY.

110522r Structure and reactivity of hydrazine derivatives.  
XXII. Kinetics of reactions of ethyl chloroformate with some  
nucleophilic reagents. Grekov, A. P.; Veselov, V. Ya. (Inst.  
Khim. Vysokomol. Soedin., Kiev, USSR). Zh. Org. Khim.  
1970, 6(2), 201-8 (Russ). The reaction rates (in the 25-55°  
range), activation energies, Arrhenius frequency factors, and  
entropies were detd. for the reaction of ClCO<sub>2</sub>Et with H<sub>2</sub>NR (R  
is Ph, PhNH, PhNMe, PhO<sub>2</sub>CNH, BzNH, BzNMe, PhCSNH,  
or PhCSNMe), which gives RNHCO<sub>2</sub>Et. The high reactivity  
of the hydrazine derivs. is due to their intermol. H bonding and  
the formation of cyclic transition complexes with ClCO<sub>2</sub>Et.  
These complexes cannot be formed by  $\alpha,\alpha$ -disubstituted hydra-  
zines which thus have lower reactivity in respect to ClCO<sub>2</sub>Et.

COMBINED EFFECT OF 5-BROMURACIL, STREPTOMYCIN AND  
CHLORTETRACYCLINE ON ACT. AUREOFACIENS

S. J. Veselova

National Institute for Antibiotics, Moscow

The effect of 5-bromuracil, chlortetracycline, streptomycin and their combinations on variation of the antibiotic-production property in Act. aureofaciens was studied. The maximum rate of plus variants with respect to antibiotic production was observed on the use of 5-bromuracil combination with the antibiotics. The analysis of the data with the use of criterium  $X^2$  allowed to conclude that increased rates of plus variants and decreased rates of minus variants on combined treatment of the cultures with 5-bromuracil and the antibiotics were due to the effects of both 5-bromuracil and the antibiotics.
