"Stability Of Frequency And Output Power Of A Transit Self-Excited Oscillator With An Oscillatory System Of An Arbitrary Form"

Elektron. tekhnika. Nauchno-tekhnik. sb. Elektron. SVCh (Electronic Technology. Scientific-Technical Collection. Microwave Electronics), 1970, Issue No 10, pp 30-42 (from RZh--Elektronika i yeye primeneniye, No 3, March 1971, Abstract No 3A148)

Translation: By use of expressions for the active and reactive constituents of electron conductivity, formulas are obtained for computation of the parameters of a transit oscillator with a multicavity oscillatory system. Expressions are deduced which determine the instability of the generation frequency with respect to changes of the standing wave ratio of the load, the voltage, and the current of the oscillator. The amplitude of the voltage in the gap of the output cavity and the output power of the oscillator are also determined. 5 ref.

"Measuring Semiconductor Diode Loss Resistance"

Moscow, Pribory i Tekhnika Eksperimenta, No. 3, 1971, pp 145-147

**Abstract:** The loss resistance, usually designated  $r_s$ , is one of the semiconductor diode parameters determining the frequency range of the diode. This article describes an instrument for measuring this quantity which overcomes the defect of an earlier device for the same purpose by using a peak detector instead of the low-frequency filter used in the earlier system, thus increasing the signal obtained from the diode under test. A block diagram of the new system plus a schematic are given, together with an explanation of its operation. The instrument can be used for measuring the loss resistance in tunnel diodes and in varactors biased in the forward direction. The authors are associated with the Tomsk Polytechnical Institute.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN HYDROCHLORINATION, IT IS EXPEDIENT TO GIVE THE RAW MATERIAL A PRELIMINARY TREATMENT WHICH DOES NOT CONTAIN A POSSIBLE SOURCE OF A REDUCER OF FE PRIME2POSITIVE TYPE. WITHOUT SUCH TREATMENT, ONLY PURE QUARTZ GRAVITATION CONCS. CONTG. LESS THAN OR EQUALS TO 1.0PERCENT SULFIDES CAN BE TREATED. GRAVITATIONAL CONCS. CONTG. SULFIDES (PYRITE, ARSENOPYRITE) IN AMTS. GREATER THAN 1.0PERCENT CAN BE HYDROCHLORINATED WITHOUT PRELIMINARY TREATMENT. ONE OF THE SIMPLEST METHODS OF PRELIMINARY TREATMENT IS OXIDIZING ROASTING, WHICH CONVERTS THE SULFIDES TO OXIDES WITH HIGHER VALENCES, WHICH ARE PRACTICALLY INERT TO GASEOUS CL<sub>2</sub> IN THE AQ. MEDIUM. EXTN. OF AU FROM THE CINDERS OF OXIDIZING ROASTED GRAVITATIONAL CONCS. WAS IN MOST CASES 98-98.5PERCENT. THE HIGHEST EXTN. WAS OBTAINED AT RELATIVELY SHORT TIMES (SIMILAR TO 2 HR) AND WITH LEAST CONSUMPTION OF CL<sub>2</sub>. THREE VARIATIONS OF EXTN. OF AU FROM SOLN. WERE TRIED: REON. BY FE PRIME2POSITIVE, SORPTION ON PITCH, AND EXTN. BY TRIOCTYLAMINE. EXTN. AND REON. BY FeCl<sub>3</sub> SUB2 GAVE PRACTICALLY COMPLETE RECOVERY OF AU FROM THE SOLN. THE RESIDUAL CONCN. OF AU WAS 0.09 MG-L. WHEN THE INITIAL CONCN. WAS 2000 AND 50 MG-L. SORPTION ON PITCH GAVE SOMEWHAT BETTER RESULTS.

"Extraction of Gold from Gravitational Concentrates by the Hydrochlorination Method"

Moscow, Tavetnyye Metally, No 3, Mar 70, pp 74-76

**Abstract:** Research in the gold extraction industry has recently turned to processes involving chlorination of the gold-bearing concentrate. Hydrochlorination of gravitational concentrates was found to yield 99% extraction of high-assay (999) gold. The gold content in gravitational concentrates ranges from 40 to 900 g per ton. Some of the gold is combined with sulfides (pyrite and arsenopyrite) and quartz. The experimental process described in this study was carried out on a small laboratory unit incorporating a 1.5 l plexiglass reactor with an agitator. The results of the hydrochlorination of unroasted gravitational concentrates and data on Au extraction into solution in hydrochlorination of cinder at 8 plants are summarized in tables in the original article. It is suggested that gravitational concentrates containing sulfides > 1.0% be pretreated by oxidizing firing to convert the sulfide compounds to oxides of higher valence, which are almost inert to Cl<sub>2</sub> in an aqueous medium. A total of three extraction variants from solutions were tested: reduction with FeCl<sub>2</sub>, sorption with AM resin, and extraction with trioctylamine. Extraction and reduction with FeCl<sub>2</sub> have shown a higher yield while that of sorption with AM resin was somewhat lower.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. AN EQUATION SET IS OBTAINED WHICH DESCRIBES THE OSCILLATIONS OF AN ISOTROPIC ELECTRON FLUID IN A QUANTIZED MAGNETIC FIELD. FERMI FLUID INTERACTION IS ASSUMED TO BE OF THE CONTACT TYPE AND IS DESCRIBED BY TWO CONSTANTS. BRANCHES OF THE PROPER FREQUENCY SPECTRUM WHOSE EXISTENCE IS COMPLETELY DUE TO QUANTIZATION OF THE ELECTRON ORBITAL MOTION (QUANTUM WAVES) ARE CONSIDERED IN THE CASE OF PROPAGATION ALONG THE DIRECTION OF THE MAGNETIC FIELD. IN CONTRAST TO SUCH WAVES IN AN ELECTRON GAS (PRIME4-8), QUANTUM WAVES IN A LIQUID, AS A RULE, ARE RELATED TO OSCILLATIONS OF THE SPIN DENSITY. UNDER CERTAIN CONDITIONS THE EXISTENCE OF QUANTIZED SPIN WAVES IS POSSIBLE. IT IS SHOWN THAT THE LONGITUDINAL QUANTUM WAVES STRONGLY INTERACT WITH OSCILLATIONS OF THE ION LATTICE OF THE METAL. LIMITS OF APPLICABILITY AND OF TEMPERATURE SMEARING OUT OF THE FERMI DISTRIBUTION.

"Use of Electromagnetic Stirring in Vacuum Melting of Steel in a Ladle"

Moscow, V sb. "Sovremennyye problemy kachestva stali" (MISiS), (Collection of Works. Modern Problems of Steel Quality) (Moscow Institute of Steel and Alloys), Izd-vo "Metallurgiya," No 61, 1970, pp 222-227

Translation of Abstract: Brief technical characteristics are given of the electromagnetic stirring of steel in a ladle. Data are presented on the effect of electromagnetic metal stirring on the uniform distribution of added deoxidizers and alloying elements, and also on the significant increase in the duration of vacuum smelting. A new production technology for the ShKh15 steel is presented in which complete deoxidation and alloying is conducted in the ladle at the end of vacuum smelting. The suggested method is theoretically substantiated. The results of the first experimental melts are presented. 3 tables.

Lukov, A. I., B. K. Zymov, and V. I. Volkov,

The relationship between thermal and electrical conductivities of graphite.

I-FZh, v. 22, no. 5,

1972, 932. (Annotation).

An attempt to correlate thermal conductivity  $\lambda$  with electric resistivity  $\delta$  of graphite at high temperatures is described.

Many researchers previously noted that the  $\lambda \times \delta$  product is constant to a certain degree, but only at room temperature.

Experimental  $\lambda$  and  $\delta$  data in the range 80 - 2,500°K are given and the  $(\lambda \times \delta)$  values are calculated for artificial graphite with  $1.0 - 2.26 \text{ g/cm}^3$  specific weights. At a low temperature, the  $(\lambda \times \delta)$  of individual graphites varied significantly. At room temperature,  $(\lambda \times \delta)$  was nearly the same for the graphites studied. At  $T > 1,500^\circ\text{K}$ ,  $(\lambda \times \delta) = 0.34 - 0.38 \text{ V}^2/\text{degree and } 1\text{eV}$ . Experimental  $\lambda$  and  $\delta$  data in the range 80 - 2,500°K are given and the  $(\lambda \times \delta)$  values are calculated for artificial graphite with  $1.0 - 2.26 \text{ g/cm}^3$  specific weights.

Voromin, V. I., and A. Ye. Blazhkov.

Thermal boundary layer on a nonisothermal plate. IVUZ. Aviatsionnaya tekhnika, no. 1, 1972, 119-123.

The equation of energy of a compressible laminar boundary layer on a semi-finite plate with different local boundary conditions is analyzed. It is assumed that the  $0 \leq \xi \leq 1$  area of the leading edge, where  $\xi = x/l$  and  $x$  is the longitudinal coordinate, is cooled to a constant temperature  $T_{wo}$ , and its equation of energy is solved by the known Crocco integral. Using this integral and a

"Synthesis of Pure Trimetaphosphimic Acid"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 4, Apr 70, pp 937-938

Abstract: Continuing their work on the synthesis of stable trimetaphosphimic acid (TMPA), the authors developed a method for its synthesis in an aqueous solution free of admixtures of foreign ions which affect the stability of the acid, with subsequent isolation in the crystalline state. The initial product is the Na salt of TMPA,  $\text{Na}_3(\text{PO}_2\text{NH})_3 \cdot 4\text{H}_2\text{O}$ , obtained by hydrolysis of triphosphonitrile chloride with sodium acetate.

"Thermodynamics of a Flow of Evaporating Liquid in the Case of High Pressure Gradients"

Tr. Vses. nauchno-tehn. konferentsii po termodinamike. Leningr. tekhnol. in-t kholodil'n. prom-sti (Works of the All-Union Scientific and Technical Conference on Thermodynamics. Leningrad Technological Institute of the Refrigeration Industry), Leningrad, 1970, pp 137-146 (from RZh-Turbostroyenie, No 8, Aug 70, Abstract No 8.49.21)

Translation: The thermodynamic method is used with regard to peculiarities of the mechanism of the actual process to analyze and calculate the process of vaporization of a superheated liquid. Rather than taking the condition of bubble formation in the flow nucleus behind the boiling front as the determining factor, the authors proceed from the actual nature of hydrodynamics of viscous flow, taking the development of vapor formation throughout the cross section of the flow under limiting outflow conditions, since conditions which are more favorable for vapor formation are created in the boundary layer in this case. In effecting the initial thermodynamic analysis, the complexes which account for initial underheating and the work of forces

of friction lead to quantitative changes in the evaluation of the process which coincides with reality. The way in which the critical ratio between pressure and the coefficient of velocity depends on the degree of underheating is determined, and a divergence within limits of 5% between theory and experiment indicates that flows of wet steam may be treated as mechanically one-dimensional at supercritical velocities. This makes it possible to study such flows by purely thermodynamic methods and to determine the degree of dryness of the flow, the enthalpy of the liquid phase and its temperature, and losses of energy due to disruption of thermodynamic equilibrium. Four illustrations, bibliography of five titles. L. F. Kallistova.

generator efficiency is 50% at an exhaust gas temperature of 150-160°C. Addition of a preheat chamber raises this figure by 1%. A significant increase in economy (up to 55%) is realized by conversion to 2-stage heating in the gas turbine. A large increase in gas turbine output can be obtained by adding recirculation lines--a portion of gas vaporized by the steam generator receives only one stage of compression, after which it is injected into the combustion chamber. The remainder of the output gas (at 2 atm. pressure) is expanded in the condenser. A semi-closed cycle design of this type, at an input pressure of 12 to 14 atm. and a turbine path length of 600 mm., can produce 650 to 700 Mw at 52% efficiency. The design of a cooled gas turbine remains a basic problem. Five illustrations.

"Effect of Turbulence on Transition in the Boundary Layer of  
Gas Turbine Profiles"

Moscow, Teploenergetika, No 12, 1971, pp 45 -46

Abstract : Results are presented of experimental investigation of the turbulence effect on transition in the boundary layer of typical gas turbine blades. Data of processing experimental results of turbulence measurements in the stator lattice of gas turbine blades under static conditions and conditions of lattice arrangement behind the rotating turbine wheel are discussed by reference to diagrams of characteristic Reynolds numbers (  $Re$  ) at points of starting (  $Re_s$  ) and ending (  $Re_e$  ) transition. The presence of the rotating turbine wheel before the stator effects increased turbulence of the flow entering the nozzle lattice. At

values of the turbulence level  $\varepsilon > 4.5 \%$ , according to experiments on the dynamic test bed, a tendency to stabilization of  $Re_s$  around the value of  $1.2 \times 10^5$  was observed. The relative expansion of the transition zone under static and dynamic test conditions of the characteristic parameter of the transition zone  $r = Re_s/Re_e$  can be approximately rated by empiric formulas previously ( Ibid., No 7, 1969 ) suggested by one of the authors. Four illustr., three formulas, ten biblio. refs.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN THE PAPER A COMPARATIVE EVALUATION OF SOME MOST FREQUENTLY USED ANALGESICS IS GIVEN. FOR MEASURING PAIN THRESHOLDS AN APPARATUS DOLORIMETRE, DEVISED BY THE AUTHORS HAS BEEN EMPLOYED. MORPHINE IN A DOSE OF 10 MG, OMNODON, 20 MG AND PROMEDOL, 0.5 MG PER KG WEIGHT EXHIBIT A SIMILAR ANALGETIC ACTION. ANALGINE IN A DOSE OF 500 MG DOES NOT SHOW ANY CHANGES IN THE PAIN THRESHOLDS. A COMBINATION OF 10 MG OF PROMEDOL WITH 500 MG OF ANALGINE, ALSO INCREASING THE PAIN THRESHOLDS AS MORPHINE IN A DOSE OF 10 MG, DOES NOT SHOW ANY SIDE EFFECTS TYPICAL OF MORPHINE, THAT ENABLED TO RECOMMEND THIS COMBINATION OF ANALGESICS FOR THE POSTOPERATIVE ANALGESIA.

"Procedure for Obtaining a Luminescent Compound"

USSR Author's Certificate No 312864, filed 13 Aug 69, published 2 Dec 71 (from RZh-Khimiya, No 12, Jun 72, Abstract No 12L187P)

Translation: In order to reduce the cost and to obtain luminescent compounds which are efficient with respect to brightness of their luminescence a group III metal orthovanadate and orthophosphate are used in combination with mixed group II metal orthovanadate and orthophosphate. Various rare-earth elements or a mixture of a rare-earth element and Bi is used as the activator. The activator and Bi are taken in the amount of 0.01-0.2 g/atom proper mole of final product. The luminous compound obtained by the proposed procedure corresponds, for example, to the formula:  $\text{Me}_{(3-1.5x)}^{2+} \text{Me}_x^{3+} (\text{V}_{1-y}^{2+} \text{K}^+)^{y/2} \text{O}_4$ .

\*zA where  $\text{Me}^{2+}$  are  $\text{Ca}^{2+}$  or  $\text{Sr}^{2+}$  ions with partial replacement by  $\text{Zn}^{2+}$  or  $\text{Mg}^{2+}$  ions; the  $\text{Me}^{3+}$  are  $\text{Y}^{3+}$  or  $\text{La}^{3+}$  or  $\text{Al}^{3+}$  ions; K is a group V element of the periodic system, for example, V; A are the activator ions  $\text{Sn}^{2+}$  or  $\text{Eu}^{3+}$  or  $\text{Sm}^{3+}$  or combined with a sensitizer, for example, Bi;  $0.05 < x < 0.5$ ;  $0 < y < 0.5$ ;  $0.01 \leq z \leq 0.2$ . In order to obtain the compound, the charge components are 1/2

"Microelectronics In Control Systems Of Rectifier Converters"

Sb.nauch.tr. po probl. mikroelektron. Mosk. in-t elektron.tekhn. (Collection Of Scientific Works On Problems Of Microelectronics. Moscow Institute Of Electronics Technology), 1971, Issue 7, pp 73-82 (from RZh:Elektronika i yeye primenenie. No 5, May 1972, Abstract No 5B539)

Translation: The paper considers problems of the construction of the control systems of thyristorized converters using the discrete principles of the computing arts with the application of integrated circuits, using the control system of a 3-phase bridge circuit as an example. The control voltage is converted into a code and is recorded in a digital delay unit. The latter converts the recorded number into a time interval between the synchronizing pulses being produced by the zero organs and the output pulse of the delay unit which is fed to the register. The register carries out a distribution of the pulses from the thyristors which are previously amplified by an amplifier. The feedback unit converts the output parameter of the power part into code which is introduced into the digital delay unit. The principal requirements imposed on the integrated circuit used in the control system are presented. 6 ill. 7 ref.

ZYUBIN V.F."Null Element"

Sb. nauchn. tr. po probl. mikroelektron. Mosk. in-t elektron. tekhn. (Collection Of Scientific Works On Problems Of Microelectronics. Moscow Institute Of Electrical Engineering), 1969, Issue 2, pp 242-246 (from RZh--Elektronika i yeye primeneniye, No 1, January 1971, Abstract No 1B452)

Translation: It is proposed to fulfill a null element [НУЛЬ-ОРГАН] on the base of an integrated circuit which includes two type n-p-n planar transistors with the collectors and emitters connected among themselves: the transistor base is connected across limiting resistors to the terminals of the secondary winding of the transformer; the midpoint of this winding is lead up to the emitters of the transistors mentioned; stabilitrions are provided between the midpoints of the limiting resistors and the emitters. Because of the pronounced nonlinear characteristics of the integrated circuit, it is possible to obtain a pulse width of 1-2° of the period of the control voltage, and the duration of the front is one microsecond; the power which is consumed is  $\sim 100$  mwatt. It is possible to assemble an analogous circuit using ordinary transistors, but with some worse characteristics. 3 ill. 3 ref. I.R.

"Unit For Control Of Thyristors"

Sb. nauchn. tr. po probl. mikroelektron. Mosk. in-t elektron. tekhn. (Collection Of Scientific Works On Problems Of Microelectronics. Moscow Institute Of Electrical Engineering), 1969, Issue 2, pp 247-250 (from RZh--Elektronika i yeye primeneniye, No 1, January 1971, Abstract No 1B452)

Translation: The paper describes a one-channel system for control by a bridge circuit of a thyristor rectifier [выпрямитель] during which asymmetry in the units for control of the thyristors is excluded. The control system consists of 1) Three null elements [нуль-органи] connected to line voltage; 2) Unit for summation of pulses synchronized with a-c voltage which are obtained through the null elements; 3) Units for phase control where shift of all pulses is accomplished simultaneously; 4) Distributor of pulses to the six channels for control of the thyristors; and 5) Amplifier-shaper. In addition to elimination of asymmetry, the circuit has the advantage that it has a smaller number of elements and the logical possibilities of the system are better utilized. Construction of a one-channel system using integral elements is possible. 3 ill.

"Metallized Coatings to Protect Welds from Corrosion Cracking"

L'vov, Fiziko-Khimicheskaya Mekhanika Materialov, No 3, May-June 70, pp 22-24

Abstract: Welded samples of St. 3 steel measuring 300 x 500 x 7 mm and 250 x 500 x 4 mm with a seam length of 500 mm and with a residual welding stress of the seams approaching the yield point of the base metal were subjected to corrosion cracking with the application of an external load. A portion of the plates were cut transverse to the weld seam to produce samples measuring 300 x 30 x 7 and 250 x 20 x 4 mm which were subjected to a bend load to the yield point (one before coating, the other after coating). Both types of samples were sandblasted to clean and roughen their surfaces. The surfaces of the samples were electroplated with nickel, copper, zinc, iron, St. 3 steel, or 1Kh18N9T stainless steel using alternating current at 25 v. Coating thickness ranged from 0.1 to 1.2 mm to permit determination of the optimum thickness which would provide the best coating-base metal bonding and the most reliable protection of the surface from corrosive media, and which would allow the metal sample to be strained without rupture of the coating.

The best results were produced with a coating of 1Kh18N9T stainless steel. Out of 10 samples coated with this steel, not one ruptured. This was true whether 1/2

USSR

ZYUBRIK, A. I., et al., Fiziko-Khimicheskaya Mekhanika Materialov, No 3, May-June 70, pp 22-24

the corrosive medium was a nitrate ( $\text{NH}_4\text{NO}_3$ -50% solution) or alkali (NaOH-40% solution), where the corrosion rate was 0.8 and 0.9 kg/ $\text{m}^2\text{-hr}$  respectively. Optimum coating thickness was 0.4 mm, where the time to cracking was close to 100 hours in the nitrate solution.

The authors state that additional protection against corrosion cracking may be achieved by using resins and lacquers.

"An Investigation of Corrosive Cracking of High-Strength Steels in Some Media"

Kiev, Fiziko-Khimicheskaya Mekhanika Materialov, Vol 7, No 4, 1971, pp 19-23

**Abstract:** The present article is a continuation of research dealing with the cracking of high-strength hardened U8A carbon steel in acid and neutral media. The development of a crack in a sample undergoing testing for corrosive cracking brings about a gradual decrease of cross section. Therefore, if equally loaded samples are preliminarily held in the medium for different lengths of time, and are then tested for short-time strength in air, this short-time strength must continually decrease with increase of the time the sample is held in the medium. The indicated nature of the change between the short-term strength of the samples and the kinetics of crack development has a specific relationship; various sectors of the curves correspond to various stages of corrosive crack development. These stages of crack development are explained from the point of view of the electrochemical theory of corrosive cracking. 5 figures. 2 tables. 8 references.

"On The Problem Of The Application Of Photopotentiometers As Function Generators"

Radiotekhnika i elektronika, Vol XVII, No 5, May 72, pp 1067-1072

Abstract: A computation of the profile of the resistor of a function photopotentiometer is presented, based on the solution of a two-dimension Laplace equation with the condition of the existence of a leakage current lengthwise of the entire device. A criterion is obtained for the applicability of a one-dimensional approximation during computation of a function photopotentiometer. The conditions imposed on the transfer function are determined. The theoretical positions of the paper are confirmed by experimental studies conducted with models of function photopotentiometers made of electrical conducting paper. A cosine function was chosen as a control transfer function. Measurements were made with the aid of the EEDA-60 integrator of the Institute Of Mathematics, Academy Of Sciences, Ukrainian SSR. A comparison is shown of the dependence of the error of a function generator on the magnitude of the scaling constant for one-dimensional and two-dimensional approximations. The potential distribution at the resistor--photolayer boundary is shown for a function photopotentiometer operating in a regime of leakage currents. The elimination of the errors of a function generator connected with the presence of leakage currents across the photolayer is the principal result of the paper. This offers the prospect of

## NEW BOOKS ON COMMUNICATIONS REVIEWED

[Book review. Moscow, Vestnik Sovzak, Russian, No. 8, August 1972, back cover]

Following are brief reviews of books recently published by *Vestnik Sovzak*, which are of interest to readers of the magazine *Vestnik Sovzak*.

KOROBOV, A. G., Korobov, Yu. P., *Teoriya Peredachi Sinalov (Signal Transmission Theory)*, 1970, 220 pages. Price 77 Kopeks.

This book represents a textbook written in accordance with the program of a course by the same name given in communications higher educational establishments.

The book examines the theory of signal transmission as a unified scientific discipline whose basis consists of the signal theory, reliability, performance, and information theory.

General features involved in the transmission of data via communication channels are described, potential possibilities of signal transmission and reception methods are presented, comparisons are made between various communication systems, and new directions in the technical realization of modern systems are discussed.

Principal attention in the book is focused on a description of methods and concepts necessary for the solving of principal ideas inherent in modern theory. The authors strive to free their description from any dependence on mathematical facts for the purpose of making clear the physical interpretation of the obtained results. For the same reason the basic theoretical positions are illustrated with concrete examples from various fields of communications technology.

"Methods of Interference-Free FM and PM Reception. Collection of Articles on Materials of the Second All-Union Symposium on Problems of Interference Resistance in Communications Systems With Frequency and Phase Modulation"

Metody pomokhoustoychivogo priyema CHM i PM. Sb. stately po materialam II Vses. simpoziuma po vopros. pomokhoustoychivosti sistem svazi i elektroniki i Fazovoy modulyatsii (cf. English above), Moscow, "Sov. radio", 1970, 239 pp, ill. 62 k. (from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12A41 K)

Translation: In connection with the rapid and quite extensive introduction of interference-free FM and PM reception in space and tropospheric studies and other types of radio lines, chiefly in tracking reception systems, there has been somewhat of a lag between theory and practice in tracking reception, frequently leading to non-optimum systems design. Like some other books which have come out in recent years, this collection aims at helping to narrow this gap. The book contains works of leading specialists in this area dealing with the general theory of interference resistance and FM tracking reception, with some methods of theoretically investigating tracking reception systems, with a new physical threshold model, and also the results of theoretical and experimental studies of various specific systems of interference-free FM recep-

"Optimum Processing of Continuous Signals"

V sb. Metody pomekhoustoychivogo priyema ChM i FM (Methods of Interference-Free FM and PM Reception--collection of works), Moscow, "Sov radio", 1970, pp 5-11 (from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12A81)

Translation: It is shown on the basis of the theory of potential resistance to interference that optimum reception of continuous messages may be realized either by using a receiver which contains a linear optimum filter and demodulator, or by using a receiver which realizes correlation processing of received signals. In the second case, optimum reception is realized by a filter with variable parameters, or a follow-up correlator. Existing circuits for reducing the threshold of interference stability in the case of frequency modulation are modifications of circuits for optimum reception of continuous signals. Resumé.

"Determination of Total Soluble Organic Acids in the Culture Fluid During Deep Cultivation of Some Micro-organisms"

Moscow, Prikladnaya Biokhimiya i Mikrobiologiya, Vol 6, No 4, Jul/Aug 70, pp 462-466

**Abstract:** A modification of the Van Slyke-Palmer method was used to determine potentiometrically the concentration of carboxylic acids in the culture fluid during deep cultivation of certain micro-organisms. The phosphates with calcium hydroxides and the calcium salts titrated with dilute hydrochloric acid. The end point of titration was established for valeric acid and then tested on propionic, caprylic, and adipic acids. The mean relative error for these acids ranged from 2 to 8%. Candida yeasts were used in the experiments. The procedure makes it possible to determine total carboxylic acids more accurately than by direct potentiometric titration of fatty acids. It is particularly useful when the concentrations of carboxylic acids are so low that the calcium salts do not precipitate.

"Theory of Parametric Electrostatic Wave Excitation in a Fully Ionized Plasma"

Gor'kiy, Izvestiya VUZ--Radiofizika, Vol 14, No 1, 1971, pp 36-43

Abstract: This paper considers the stability of a relatively dense and fully ionized plasma in an external weak uhf field. The assumption is made that the oscillation wavelength is much smaller than the dimensions of the system and the nonuniformity in the uhf field, but is greater than the length of the mean free path of the particles. The case of parametric interaction of the uhf field with the plasma when the frequency of the field is close to the electron Langmuir frequency is examined, since it is in this case that a variation in the plasma oscillations can occur even at relatively low uhf field intensities. The basic problem of the article is to determine the threshold values of the uhf field intensity corresponding to the excitation of the various modes of electrostatic oscillation in the plasma, and find the increments of instability near the thresholds. The authors show that aperiodic as well as periodic instabilities can occur in hydrodynamic as well as in kinetic oscillation regions.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. PARAMETRIC EXCITATION OF POTENTIAL OSCILLATIONS IN A COMPLETELY IONIZED PLASMA LOCATED IN A WEAK U.H.F. ELECTRIC AND STATIONARY MAGNETIC FIELDS IS CONSIDERED WITHIN THE FRAMEWORK OF THE KINETIC THEORY. A DISPERSION EQUATION IS DERIVED FOR DETERMINING THE POTENTIAL OSCILLATION SPECTRUM ON BASIS OF THE KINETIC EQUATION CONTAINING A LANDAU COLLISION INTEGRAL. PARAMETRIC EXCITATION OF WAVES PROPAGATING ALMOST ALONG THE MAGNETIC FIELD IS INVESTIGATED FOR THE CASE WHEN THE EXTERNAL U.H.F. FIELD FREQUENCY OMEGA SUB0 IS CLOSE TO THE ELECTRON CYCLOTRON FREQUENCY OMEGA SUBE. THRESHOLD VALUES OF THE U.H.F. FIELD STRENGTH ARE FOUND ABOVE WHICH THE PLASMA IS UNSTABLE WITH RESPECT TO POTENTIAL OSCILLATION BUILD UP. IT IS SHOWN THAT DEPENDING ON THE PLASMA PARAMETERS, A STATIONARY MAGNETIC FIELD MAY EXERT A STABILIZING AS WELL AS AN UNSTABILIZING EFFECT ON THE INSTABILITIES. A QUALITATIVE COMPARISON WITH AVAILABLE EXPERIMENTAL DATA IS MADE AND AGREEMENT WITH THE THEORETICAL PREDICTIONS IS FOUND.

"An Electron-Optical Learning System"

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, 1970, No 25, Soviet Patent No 278229, class 42, filed 31 Jan 69, published 5 Aug 70, p 135

Translation: This Author's Certificate introduces an electron-optical learning system for recognition of acoustic and radar signals. Two-dimensional moments of the "instantaneous amplitude spectrum" are taken as the input signal characteristics. The device contains an "instantaneous spectrum" shaper, a specialized electronic computer, and a control module. As a distinguishing feature of the patent, the system is simplified and operating effectiveness is improved by connecting to the output of the "instantaneous spectrum" shaper a device which generates light flux modulated by the "instantaneous spectrum" of the signal to be recognized. This light generator is coupled to a multiple-channel optical correlator with electrical outputs proportional to the two-dimensional moments of the instantaneous amplitude spectrum. These electrical outputs are connected to the electronic computer.

"Device for Formation of Characteristics During Recognition of Patterns"

USSR Author's Certificate Number 307411, filed 6/04/70, published 29/07/71, (translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 3, 1972, Abstract No 3 A379 P)

Translation: For formation of characteristics during recognition of patterns a device is suggested containing a source of coherent light, a collimator, a transparency with the pattern to be recognized, and a Fourier transform lens along the optical axis of the device. In order to increase the speed and reliability of recognition, an optical system to multiply the light flux-such as a matrix of a small-diameter lens and a converting lens-is placed between the collimator and transparency, while a matrix of masks and photoreceptors, based on the number of light fluxes multiplied, is placed in the output plane of the device. 1 figure.

"A Multichannel Optical Correlator"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki,  
No 7, Mar 72, Author's Certificate No 329612, Division H, filed 29 May 70,  
published 9 Feb 72, p 212

Translation: This Author's Certificate introduces: 1. A multichannel optical correlator with two-dimensional channels. The device contains a coherent light source, a collimator, a transparency carrying an image of the pattern to be recognized, a Fourier-transform lens, and a photocell matrix. As a distinguishing feature of the patent, in order to improve the accuracy of registration of correlation functions, a reflecting diffraction grating is placed in the rear focal plane of the lens, which performs Fourier transformation of the light flux passing through the transparency carrying a recording of the image to be processed, and a reference-mask matrix is placed together with the photocell matrix in the forward focal.

plane of the lens. 2. A modification of this correlator distinguished by the fact that stray light beyond the photocell inputs is reduced by making the diffraction grating with an opening for filtering out the fixed component of the image being processed.

ABSTRACT/EXTRACT--(U) GP-0 ABSTRACT. SOLUTION OF THE FIRST MAIN PROBLEM OF THE THEORY OF ELASTICITY FOR A SPACE WITH A SPHERICAL CUT, USING AS THE INITIAL DEPENDANCES CERTAIN INTEGRAL RELATIONS OBTAINED WITH THE AID OF A TRANSFORMATION DEVELOPED BY POLOZHII AND ALEKSANDROV (1961, 1962, 1965). A SPECIFIC EXAMPLE IS GIVEN, INVOLVING A SPHERICAL CUT UNDER THE ACTION OF SYMMETRICAL AND ANTSYMMETRICAL UNIFORM LOADS APPLIED AT THE EDGES. CLOSED FORM EQUATIONS ARE DERIVED FOR DETERMINING THE NORMAL AND TANGENTIAL STRESSES.

"Some Problems of the Theory and Practice of Ingot-Free Rolling of Aluminum Bands"

Metallovedeniye Splavov Legkikh Metallov-Sbornik, Moscow, "Nauka", 1970,  
pp 165-171, resume

Translation: Thermophysical constants of the melt and the solidified metal in the range of the crystallization temperature are investigated as constants not depending on temperature. The production process of the band by the method of ingot-free rolling is analyzed. As a result of processing data of all ingot-free rolling parameters, the liquid metal temperature dependence of the process rate was established. Two figures, four bibliographic references.
