The comparison of the intensities of the (2-0) bands of CO+ (in the tail) and the (0-1) bands of CN (in the head), at various distances from the nucleus, in Bester's Comet (1917E) has allowed the determination of the relative abundances of CO+ and CN at less than 150,000 km from the nucleus. It is found that the abundance of CO+ in the tail is 30 to 40 times greater than that of CN in the head. If the abundance for CN is taken equal to that suggested for C₂ by Burn, it is found that in the region of
