Trans. of Archiv für das Eisenhüttenwesen (West

The course of aging of basic bessemer, converter  
alloy and electric steels with a dissolved carbon con-  
tent of up to 0.019% at different temperatures was in-  
vestigated by tensile testing, and by damping and co-  
ercive force determinations. Studies of aged speci-  
mens were supplemented by recovery investigations  
and the results were compared with those of quench  
aging. The changes of strength characteristics and of  
coercive force, as a function of the aging time and of  
aging temperature, are characteristic of quench aging.  
These changes suggest that carbide formation during
