ZrCl₄ forms a dietherate with CH₃OCH₃; its infrared
 spectrum is discussed. During its pyrolysis, two
 processes are superimposed: 1) dissociation with for-
 mation of the monoetherate; the corresponding heat of
 dissociation is determined from the vapor pressure
 curve as 10.5 kcal/mole. 2) decom. ation to the
 monomer or condensed chlorine-containing methyl
 zirconate, which occurs with formation of methyl
 chloride. The chemism of these reactions can be
 studied via the infrared spectrum. (Author)

DESCRIPTORS: *Oils, Catalysts, *Esterification, Chemical reactions, Processing, Glycerols, Fatty acid esters, Acceleration, Crystallization, Stirrers.

The directed interesterification of palm oil is investigated in accordance with the principles developed by E. W. Eckey. Through the different analytical methods it was possible to ascertain the influence of the reaction time, the temperature, mechanical stirring as well as the quantity and the degree of distribution of the catalyst on the changes of glyceride composition of palm oil.
