Acute and sub-acute CO poisoning in the brain is
accompanied by an accumulation of considerable
quantities of ammonia and residual nitrogen more
pronounced with sub-acute poisoning in the absence of
changes of the significant increase of free glutamine in
the brain. Sub-acute poisoning after 24 to 48 hrs leads
to a decrease of amide nitrogen of the proteins in the
brain averaging 10 mg % (Author)

Introduction of urethane into the system appears to
have an unfavorable effect on the organism of rats
during CCl_4 poisoning, reducing its power to survive.

Trans. of Ukrainskiy Khimicheskij Zhurnal (USSR)
1956, v. 22, no. 2, p. 239-246.

DESCRIPTORS: *Polarographic analysis, *Quality
control, Adsorption, Anesthetics, Food.

Adsorption polarography is shown to be applicable to
the problem of identifying the type or grade of a wide
variety of products of the foodstuff flavoring and the
pharmaceutical industries. In addition to the effect of
surface-active materials on the polarographic maxi-
mum, use may also be made of the retardation of the
electrode process which these materials exhibit. A
method capable of giving easily reproducible adsorption
polarograms, in phosphate solutions of copper, is
described. (Author)
