Giants of early spectral classes which form the spiral
branch of the Galaxy in the vicinity of the Sun move
along the spiral in the direction of its unwinding at a
rate of about 6 or 7 km/sec. Discrete clouds of the
spiral have peculiar local movements. An investiga-
tion of a cloud of B stars shows that one of the com-
ponents of the local motion is its rotation directed to-
wards the conjunction of "Gould's Belt" and the Milky
Way. A second component is a forward movement in
the direction of the centre of the Local System; the
