On the basis of the experience gathered from about  
30,000 light anesthetics in Germany, (isopropyl  
chloride) is a useful substitute for ethyl chloride, and  
can be considered capable of replacing "Trilene" as an  
analgesic. As with ethyl chloride, the excitation stage  
must not be exceeded, and should be avoided altogether.

Ammonia and ammonium nitrate in solution reacted with nitrogen oxides, forming elemental nitrogen. It was established, that by occurrence of ammonium nitrate in the solution, losses of tied nitrogen should occur in the process of nitrogen oxides absorption because of  $\text{NH}_4\text{NO}_3$  decomposition through the stage of ammonium nitrite and nitrous acid formation. Therefore application of solutions containing additives of ammonium nitrate, in the manufacture of nitric acid, without their prior removal, is unrationall (sic.).
