DESCRIPTORS: *Oils, Analysis, Liquids, Solids, Viscosity, Gasoline, Temperature, Methanes.

The effects of liquid admixed substances in solid paraffins on the height of rising in thermal capillary analysis are investigated and discussed, taking into consideration the type and quantity of the admixed substances as well as the viscosity and the solidification points of the paraffins. One of the latest developments in the field of particle
size determination in the sub-sieve range is a method
for manufacturing analytical sieves with mesh widths
down to 20 microns. Exactness of sieving, if done by
means of these novel sieves made in the USA, is by
far higher than with the conventional test sieves
hitherto used. In connection with the well-known
