DESCRIPTORS: Halogen compounds, \*Phthalic acids,  
Condensation, Polymerization, Molecular weight,  
\*Glycols, \*Ethylene.

The polycondensation of haloterephthalic acids with ethylene glycol leads to polymers endowed with a filament property, the melting point of which is lower, the greater the dissymmetry introduced into the nucleus of the terephthalic acid. Moreover, it appears that the difference in reactivity of ortho- and meta-carboxyls of the halogens influences the reaction which, depending on the case at hand, leads to more or less high polymers.
