DESCRIPTORS: \*EETN, \*Halohydrins, Synthesis.

A method is proposed for the production of pentaerythritol dichlorohydrin by conversion of pentaerythritol with hydrogen chloride at elevated temperatures and under pressure. The method is characterized by the fact that a maximum of 2 mole hydrogen chloride are used per 1 mol of pentaerythritol and that the conversion is conducted at temperatures between 120 to 160°C in the presence of an inert organic solvent for pentaerythritol.
