PRESSURE EQUALIZATION IN THE PIPE-TURNS OF
A ONCE-THROUGH BOILER. [1960] [9]p. 1 ref.
C. E. Trans. 1655; M2318.
Order from LC or SLA ml\$1.80, ph\$1.80 61-15461

Trans. of Teploenergetika (USSR) 1957, v. 4, no. 6,
p. 21-25.

An analysis is given of the functioning of breather
headers in once-through boilers for reduction of pulsa-
tion between the pipe-turns, and of the variation in
heat absorption. (Author)

DESCRIPTORS: Separation, *Proteins, *Immune serums, *Electrophoresis, Starches.

A method for determining simultaneously several protein fractions present in immune sera is described. A potato starch solution mixed with a buffer solution is distributed over the bottom of a glass dish which is partitioned lengthwise by a glass rod. Two strips of filter paper are placed on the edge of the dish to make contact with the electrodes. A second layer of buffer (Biological Sciences--Biochemistry, TT, v. 10, no. 9)

starch solution is then poured into the dish. After the plate has dried, along both sides of the glass rod 2 trenches are cut 6-7cm from the cathode. Exactly 0.5ml of serum is introduced into each trench. After absorption of the serum, the trenches are filled with buffered starch solution. Six plates are placed in the electrophoretic chamber, permitting simultaneous analysis of 12 samples. The starch plates are cut into pieces according to the size and position of each fraction. Each piece is centrifuged with 10ml of physiological saline solution. The supernatant fluids represented the isolated protein fractions. Electrophoregrams of protein fractions obtained from normal and immune horse sera, using this technique show that the protein fraction separation was quite precise.
