The fugacity, heat capacities at constant pressure and  
volume, the heat content, entropy, free energy, maxi-  
mum work and internal energy were calculated for  
methane within the temperature interval of from -70 to  
+200°C. and pressures of from 10 to 1,000 atm. Mollier  
diagrams were constructed for methane. The values  
calculated by the author were correlated with calculated  
and experimental data reported in the literature.

Single injection of ACTH to normal rabbits causes an increase in the total blood serum protein content as a result of an increase in the finely dispersed albumins. There is also a decrease in the serum globulins, which leads, in turn, to an increase in the A/G ratio. The (Biological Sciences--Physiology, TT, v. 11, no. 5) (over)
