THE COLD AND WARM AGE HARDENING OF

The cold and warm age-hardening of solution-treated and water-quenched aluminum-zinc and aluminum-zinc-copper alloys follows a simple law, if the criterion used is the time required to attain maximum hardness. In the binary system, age-hardened alloys with up to 83 at.-% aluminum (67 wt.-%) are the most stable at room temperature. Copper-bearing alloys of this type extend to about 75 at.-% (56 wt.-%) zinc. Binary alloys attain their maximum hardness during room temperature hardening, whereas copper-bearing alloys must be tempered. From the temperature-dependence of the age-hardening times, values were (Metallurgy, IT, v. 5, no. 4) (over)

DESCRIPTORS: *Liquid metals, *Alloys, Surface
tension.

The surface tension of molten binary systems tin-zinc,
aluminum-zinc, aluminum-magnesium and magnesium-
zinc was determined by means of the bubble-pressure
method. The selection of the systems permitted a com-
parison between the characteristics of molten systems
with and without compound formations in the solid state;
an interpretation of the molecular structure of molten
metal alloys was attempted from the characterizing
measuring effects. (Author)
