Pouradier, J. and Venet, A. M.  
 CONTRIBUTION TO THE STUDY OF THE STRUCTURE OF GELATIN. II. VARIATION OF PHYSICAL AND MECHANICAL PROPERTIES WITH THE MOLECULAR MASS. [1960] 17p. (7 figs. 7 tables omitted) 18 refs.

Order from S.L.A. mi\$2.40, ph\$3.30 61-10410

Trans. of [Journal de] Chem[ie] Phys[ique] (France) 1950, v. 47, [no. 5/6] p. 391-398.

Measurements were made on homogeneous gelatins obtained by fractionating a commercial gelatin. The intrinsic viscosity of these homogeneous fractions is related to molecular mass by an equation of the type  $[\eta] = KM$ , and which in the special case of fractions extracted from skin gelatin by liming and having an isoelectric point of 4.75 and an average molecular mass of 65,000, becomes  $[\eta] = 1.66 \times 10^{-5} M^{0.835}$ . The melting point of gelatin gels increases with the molecular mass and tends towards a limited value. (Author) (See also 60-10386)

DESCRIPTORS: \*Minerals, Crystals, Hardness,  
\*Chemical bonds

Study of hardness of crystals, in which the interatomic  
distances are fixed and the possibility of a permanent  
atoms in the crystal lattice that the crystals, which have  
of a certain fixed state of bonds, and hence that  
the interatomic distances are fixed. It is shown that  
the relative difference increases with the increase  
of the valence of the composing atoms and with the de-  
crease of the interatomic distances.
