Bench-mark damage in polar regions associated with
permafrost and ground ice is analyzed, and proper
construction methods are discussed. A metal pipe
about 60 mm in diameter, with a disk about 150 mm in
diameter welded on the lower end, is not liable to

Variations in ice concentration and their factors are
analyzed and formulated so as to disclose the correla-
tion of the factors and the effects they produce which,
in natural circumstances, are in constant change and
interaction. In line with this, the methods used in
computing variations in ice concentration are re-
examined and the necessary improvements introduced.
