known. Accuracy can be described as satisfactory,
when one bears in mind that considerable differences in
compressive strength are recorded on standard prisms

Mice were injected with various chelating agents after the animals had previously received injections of uranyl nitrate, i.p. If the administration takes place relatively soon (1/2 hour after the uranium salt), the LD₅₀ per 28 days, which was found to be 6.7 U/kg for the untreated animals, was increased to 12.4 by ethylene diaminetetraacetic acid and to 16.2 by diethylenetriaminepentaacetic acid. The effectiveness is strongly dependent upon the time of injection and dose of the chelating agent. Other polyanionic acids studied were found to be ineffective. (Author)
