Trans. of *Geokhimiya (USSR) 1960, no. 4,
p. 373-374.

The excess of uranium (on the average $U^{235}/U^{238} =$
1.5) in a mineral with an increased content of actinium
can be explained only by the presence of some trans-
uramic isotope which is still present in nature. The
enrichment in actinium and in U^{235} (an odd isotope of
uranium) may be due to the complicated decay scheme
of a single fissionable isotope. (Author)
