The highest value of tensile strength across the grain is shown by deciduous, diffuse, porous hardwoods; the next, by porous-ring trees, and then, by diffuse, porous softwoods. Coniferous woods show about half the tensile strength of the diffuse porous woods. The radial tensile strength is 1.3 to 1.8 times higher than (Materials--Wood, TT. v. 7, no. 4) (over)

reactions, Sensory mechanisms, *Chemoreceptors

A harmonious reflex response of respiration and blood
pressure to interoceptive stimulation requires the com-
pleteness and the linking of at least four portions of the
central nervous system: the spinal cord, the medulla
oblongata, the brain stem and the thalamus opticus.
