A review of data published in the foreign press  
(American, Canadian, etc.) on the simultaneous pro-  
duction of phenol and acetone indicates that this  
method is valued by the industry as perhaps the most  
promising and profitable method for the production of  
these products.

A literature search showed that yields up to 85% have been obtained with Cd-salt catalysts. An experimental study of the process via their dipotassium salts established that the optimum conditions are a temperature of 460°C, a reaction period of 1.5 hr, and an initial CO<sub>2</sub> pressure of at least 10 atm. A terephthalic acid yield of 73 or 74% of the theoretical can be obtained.
