Results are given of tests to find the effect of clearance  
on the vibration of rolling bearings. A method is given  
of finding the amount of radial rotor vibration, the  
disturbing forces and the frequency spectrum of the  
vibration. The theory is based on the assumption that  
the rotor of the mechanism is stiff, and there is no  
interference in the kinematics of the bearing. (Author)

Trans. of Zhurnal Nauchnoy i Prikladnoy Fotografii i Kinematografii (USSR) 1960, v. 5, no. 1, p. 34-38.

X-ray films (2X, Agfa Laue, and Agfa Texo) were sensitive to electrons with energies 2 to 40 electron volts. The Agfa Laue film was more sensitive than the others to electrons with energies of 2 to 20 ev. The relation of the densities to the electron energy within the range of 2 to 40 electron volts is shown for the films. Density has a minimum at 12 to 20 ev. When the film is developed in a "sub-surface" developer, a minimum or an inflection point exists; the density depends upon the length of irradiation time at (Materials--Photographic, TT, v. 5, no. 6) (over)
