Trans. of Vsesoyuznoye Mineralogicheskoye  
Obshchestvo. Zapiski (USSR) 1959, v. 88, no. 3,  
p. 261-274.

A close spatial and genetic link was established between the alkali pegmatites of the Afrikanda, especially their early types, and the rocks of the first two intrusive stages. All these formations belong to a single genetic group, the ultrabasic alkali rocks. In the process of crystallization of the main rocks of the intrusion (pyroxenites) loss of the strong bases, accompanied by acute undersaturation of the magma with respect to SiO<sub>2</sub>, caused a considerable part of the Fe, Ti, Na, K, Ca and Al to pass over from the main to the residual phase of crystallization. The alkali (Earth Sciences--Mineralogy, TT, v. 5, no. 5)(over)

PHOTOPOLYMERIZATION OF VINYL ACETATE.  
[1966] 7p. 13 refs.  
Order from OTS or SLA \$1.10 61-18171

Trans. of Acta Physicochimica U. R. S. S., 1944,  
v. 15, p. 266-285.

DESCRIPTORS: \*Acetates, \*Vinyl radicals, Photo-  
chemistry, Polymerization.

The photopolymerization of vinyl acetate in mixtures with ethyl acetate and benzene has been investigated. The rate of photopolymerization of pure vinyl acetate and in mixture with ethyl acetate is proportional to the square root of the intensity of incident light. A peculiar relation is established between the ratio  $V/\sqrt{I_0}$  and the concentration of vinyl acetate. The temperature dependence of the rate of polymerization corresponds to an activation energy of 6.3 kcal. The length of the molecular chain is shown to be proportional to the
