p. 140-149.

DESCRIPTORS: *Polyethylene plastics, Viscosity,
Fused materials, Molecular properties, Theory.

The temperature dependence of the viscosity of some
fused polyethylenes of increasing chain length was
determined. The results make it possible to draw
conclusions concerning the migration mechanism in
the fused phase. In this connection, it was found that
the heretofore accepted concept of the flow process of

Two new colorimetric methods for the quantitative
determination of organic peroxides are described. Both
of them operate in organic solvents and in the homo-
geneous phase. For determinations in glacial acetic
acid, the indamine method, and for determinations in
benzene, the methylene-blue method is recommended.

The influence of phenolic and nitro compounds in sup-
 pressing the oxidation-reduction emulsion polymeri-
 zation of acrylonitrile was studied. Potassium persul-
 fate and sodium bisulfite were used as oxidation-
 reduction reagents, and sodium lauryl sulfate was
 used as emulsifier. The rate and degree of polymeri-
 zation were lowered by adding phenols. Their sup-
 pressing action increased in the order: resorcinol,
 phenol, hydroquinones, pyrogallol. Pyrogallol pre-
 vented polymerization even in the presence of catalyst.

The surface and internal structure of completely hydrated and hardened cement clinker components, and their mixtures with and without gypsum, were investigated by electron-microscopic methods using ultra-microtome sections. The samples were hydrated in a ball mill at 20°C with a water/cement ratio of 0.8. As a result of these experiments the process of hardening and strength development can (Engineering--Chemical, TT, v. 8, no. 9) (over)
