Trans. of Politekhnichesty Institut Leningrad  
 Prikladnaya Mekhanika, no. 176, p. 191-200.

A new manometric method for measuring friction stress on a surface is analyzed. This method is based on Dean's theoretical solution for the slow motion of a viscous liquid in the vicinity of a thin projecting blade normal to a boundary surface. The measuring instrument is in the form of a blade fixed to a flat base; it is extremely simple and can be used for making measurements in the field as well as in the laboratory. In addition to an analysis of the new methods, considerable space is devoted to the study of methods of measuring friction stress by means of surface tubes. (Author)
