The adsorption bands of the components are condensed
in the chromathermographic analysis which permits
their separation. In the desorption with air (115
ml./min.) at 120°, benzene is not desorbed, at 240°,
toluene and benzene are desorbed quantitatively but not
separated, but at 160° they are quantitatively desorbed
and separated. The identification of the components
was based on the measurement of the combustion heat
effects of the separated components. The accuracy of
