The influence of lithium, sodium, potassium, and
calcium on the solubility of sucrose in molasses was
investigated. The strong differences in the action of
the various substances found thereby suggest that the
main influence on the sucrose solubility must be
attributed to the inorganic cations and thus confirm the

The solubility of the saccharose in impure sugar solutions is dependent upon the nature and concentration of the cations present in these solutions. The ions of the alkaline-earth metals magnesium and calcium have a strong solubility-reducing effect by binding the water present in the form of hydrates. A (Food, TT, v. 10, no. 7) (over)

THE LIMITS OF ACCURACY IN THE ANALYSIS OF

DESCRIPTORS: *Carbohydrates, *Polarographic
analysis, Polarization.

The examination of raw sugar through polarization
requires above average care and experience. The
results will be influenced by a number of factors
which are called natural errors occurring in the indi-
vidual steps of the investigation. It is very important
that the methods used by individual laboratories be
identical, in order to have differences of 0.1 or 0.2
of a degree of polarization appearing as little as
possible. A few suggestions are given. (Author)
